MULTICENTER POSTCORONARY RISK STRATIFICATION PROGRAM **2.0872**

EARLY RISK PREDICTORS FOR CHRONIC PUL-

MONARY DISEASE 2.0874
EVALUATION OF OCCURRENCE OF INFLUENZA & VACCINE EFFICACY 2.0876
CLINICAL EPIDEMIOLOGY - PATHOGENESIS OF GENITAL HERPES 2.0899
TOXOPLASMOSIS - NATURE OF INFECTION & IMMUNE RESPONSE 2.0905
PSYCHOSOCIAL AND BIOCHEMICAL RISKS FOR MONONUCLEOSIS 2.0928
NEONATAL CHLAMYDIA INFECTION - INCIDENCE AND TREATMENT 2.0932
GENETIC EPIDEMIOLOGY OF DIABETES IN RUBELLA DEAFNESS 2.0941
COMPLICATIONS AND OUTCOME OF DIABETIC AND PREDIABETIC PREGNANCIES 2.0950
LONG-TERM STUDY OF ASYMPTOMATIC AND FUTURE DIABETES 2.0963
THE ROLE OF VIRUSES IN RENAL TRANSPLANT PATIENTS 2.0966
CONTRACEPTIVE AGENTS ON BIRTH DEFECT FREQUENCY 2.0983
PERINATAL INFECTIONS, IMMUNITY AND MALDEVELOPMENT 2.1020
DIPLOCOCCUS PNEUMONIAE - INFECTION AND IMMUNITY 2.1030
CLINICAL CORRELATIONS TO VITAMIN D STATUS IN INFANTS 2.1032
SEX CHROMOSOMAL ABNORMALITIES - A PROSPECTIVE STUDY 2.1033
EPIDEMIOLOGIC STUDY OF CORD IN COHORTS 2.1100
BEHAVIORAL EFFECTS OF LEAD EXPOSURE IN CHILDREN 2.1103
HEPATOCELLULAR ADENOMA AND ORAL CONTRACEPTIVES 2.1116
EPIDEMIOLOGY OF BREAST CANCER IN OLMSTED COUNTY, MINNESOTA, 1935-1974 2.1117
GYNECOLOGIC CANCER IN PRENATALLY EXPOSED DES MOTHERS IN OLMSTED COUNTY, MINNESOTA 2.1118
THE ROCHESTER, MINNESOTA EPIDEMIOLOGY PROGRAM PROJECT 2.1140
STATISTICAL METHODS FOR CASE-CONTROL STUDIES 2.1148
AMINOGLYCOSIDE OTOTOXICITY DETERMINANTS 2.1189
CLINICAL AND VIRAL STUDIES OF SUDDEN HEARING LOSS 2.1204
DEPRESSION, INFORMATION PROCESSING AND AGE 2.1219
PROSPECTIVE STUDY OF NUTRITION IN THE ELDERLY 2.1223
PERSONAL PATTERNS PREDICTIVE OF DISEASE OR DEATH 2.1226
DISEASE TRANSMISSION ASSOCIATED WITH LAND APPLICATION OF WASTEWATER 2.1263
A LONGITUDINAL EVALUATION OF LEAD BODY BURDEN IN GROWING CHILDREN 2.1316
PROSPECTIVE STUDY OF THE PREVALENCE OF LEGIONNAIRES' DISEASE IN VETERANS WITH PNEUMONIA 2.1362
IMMUNOLOGICAL MECHANISM AFFECTING INFECTION BY HERPES GROUP VIRUSES 2.1368
PROSPECTIVE GENETIC STUDIES OF COLON AND LUNG CANCER 2.1391
SPONTANEOUS BACTERIAL PERITONITIS 2.1411
AUTOMATIC CARDIOVASCULAR DATA PROCESSING 2.1412
APPLICATION OF CYTOGENETICS TO MANAGEMENT OF PSYCHIATRIC PATIENTS 2.1432
NOTES ON THE ETIOLOGY OF MULTIPLE SCLEROSIS 2.1440
CAUSAL FACTORS IN NEGLECT AND BATTERING - A PROSPECTIVE STUDY 2.1447
LEUKEMIA IN KENYA 2.1451
PROSPECTIVE AND RETROSPECTIVE COHORT STUDIES OF MORTALITY AND MORBIDITY AMONG SWEDISH CHEMISTRY GRADUATES 2.1510
ROYAL NAVAL DOCKYARDS ASBESTOSIS STUDY - MORTALITY PROJECT 2.1519
CANCER MORTALITY IN 11,121 MALES BORN 1903-1928 - A COMPONENT OF A YUGOSLAVIAN CARDIOVASCULAR DISEASE STUDY (ABBREV) 2.1546
SCREENING PROGRAM FOR AN EARLY DIAGNOSIS OF PRIMARY CARCINOMA OF THE LIVER - INVESTIGATION OF INCIDENCE RATES OF PLC AND LIVER CIRRHOSIS 2.1549
PROSPECTIVE STUDY ON THE FREQUENCY OF MALFORMATIONS AND SPONTANEOUS ABORTIONS IN NORTHERN MORAVIA 2.1570
AN INTERVENTION STUDY OF ORAL CANCER AND PRECANCEROUS LESIONS IN RELATION TO TOBACCO USE IN RURAL INDIAN POPULATIONS 2.1606
PROSPECTIVE AND RETROSPECTIVE STUDY OF HODGKIN'S DISEASE IN RURAL POPULATION IN EAST JAVA, INDONESIA 2.1611
PROSPECTIVE STUDY ON LUNG CANCER IN CHROMIUM PLATING WORKERS 2.1630
EPIDEMIOLOGICAL STUDY OF THE NATURAL HISTORY OF STOMACH CANCER 2.1637
CARCINOGENICITY OF CHROMATES 2.1639
HIGH RISK FACTORS OF STOMACH CANCER 2.1641
PROSPECTVE STUDY OF NASOPHARYNGEAL MALIGNANCIES (CARCINOMA AND MALIGNANT LYMPHOMA) 2.1645
PROSPECTIVE STUDY OF PATIENTS INJECTED WITH THOROTRAST (PORTUGUESE LONG-TERM SIDE EFFECTS OF THOROTRAST STUDY GROUPS) 2.1655
COHORT STUDY ON HEPATITIS B CARRIERS AND LIVER CANCER 2.1658
ENDEMIC PLEURO-PERITONEAL DISEASE IN RURAL TURKEY 2.1678
ROYAL COLLEGE OF GENERAL PRACTITIONERS - ORAL CONTRACEPTION STUDY 2.1702
AN EPIDEMIOLOGICAL STUDY OF STOMACH CANCER IN NORTH STAFFORDSHIRE 2.1705
LUNG CANCER IN THE ANTIMONY INDUSTRY 2.1706
PROSPECTIVE AND RETROSPECTIVE STUDY OF THE POSSIBLE RELATIONSHIP BETWEEN HERPESVIRUS TYPE II INFECTION AND GENITAL CANCER 2.1714
DIETHYLSTILBESTROL-ADENOSIS PROJECT - GENITAL TRACT ANOMALIES AND CANCER IN FEMALES EXPOSED IN UTERO (ABBREV) 2.1728
RISK FACTORS IN BREAST CANCER 2.1798
CARCINOGENIC RISK IN ASBESTOS-CEMENT INDUSTRY 2.1799
BENIGN BREAST DISEASE - NATURAL HISTORY AND RELATIONSHIPS TO BREAST CANCER 2.1859
REGISTRATION OF WOMEN WITH PRIMARY AND SECONDARY GENITAL HERPES SIMPLEX VIRUS (HSV) INFECTION 2.1889
POSTMENOPAUSAL OESTROGEN TREATMENT AND ENDOMETRIAL CANCER 2.1893
CANCER OF THE BLADDER IN OPIUM ADDICTS 2.1905
ANALYSIS OF NORWEGIAN DIETARY SURVEY DATA 2.2000
RADIATION ASSOCIATED THYROID CARCINOMA 2.2054
LONG-TERM MORTALITY OF STEELWORKERS 2.2068
STATISTICAL METHODS IN CANCER EPIDEMIOLOGY 2.2076
CANCER MORTALITY AMONG WORKERS EXPOSED TO CUTTING OIL MIST 2.2085
MORTALITY EXPERIENCE OF WORKERS IN THE PAINTING TRADES IN THE U.S. AND CANADA 2.2097
LONG-TERM PROSPECTIVE OBSERVATION OF ASBESTOS INSULATION WORKERS IN THE NEW YORK METROPOLITAN AREA 2.2098
CANCER EXPERIENCE OF VINYL CHLORIDE POLYMERIZATION WORKERS 2.2099
RELATION OF INFECTION WITH HEPATITIS B AGENT TO NEOPLASIA IN PATIENTS WHO HAVE RECEIVED KIDNEY TRANSPLANTS 2.2103
PROSPECTIVE STUDY OF THE RELATIONSHIP OF HORMONAL AND SOCIOLOGICAL FACTORS TO THE DEVELOPMENT OF CANCERS OF VARIOUS SITES 2.2107
RISK OF NEOPLASIA IN NEIGHBORHOOD ASBESTOS DISEASE 2.2115
EPIDEMIOLOGY OF HEPATOMA AND CHRONIC LIVER DISEASE IN RELATION TO HEPATITIS B INFECTIONS IN TAIWAN 2.2132
MORTALITY EXPERIENCE OF HOUSEHOLD CONTACTS OF ASBESTOS WORKERS 2.2136
PREDICTION OF LUNG CANCER RATES BY SPUTUM CYTOLOGY 2.2137
THE PHILADELPHIA PULMONARY NEOPLASM RESEARCH PROJECT 2.2138
PROSPECTIVE STUDY OF PATIENTS WITH GENITAL TYPE II HERPESVIRUS INFECTIONS 2.2151
EPIDEMIOLOGICAL STUDIES OF CANCER 2.2159
LATE EFFECTS OF CANCER TREATMENT IN CHILDREN INCLUDING SECOND MALIGNANT NEOPLASMS - CHILDREN'S INTERNATIONAL CANCER INVENTORY 2.2167
PANCREATIC CANCER - AETIOLOGY AND DIAGNOSIS 2.2171
MORTALITY EXPERIENCE OF NITROSAMINE-EXPOSED WORKERS 2.2179
PROSPECTIVE FIELD STUDY - HORMONE ASSAYS AS A PREDICTOR OF HIGH BREAST CANCER RISKS 2.2184
INFLUENCE OF SMOKING ON CAUSES OF DEATH AMONG ASBESTOS INSULATION WORKERS 2.2189
CARDIOVASCULAR DISEASE EPIDEMIOLOGY IN 40,000 EMPLOYED CHICAGOANS 2.2198
MORTALITY-MORBIDITY STUDY AND TUMOR REGISTRY FOR PETROLEUM, REFINING, PETROCHEMICAL AND RESEARCH AND DEVELOPMENT WORKERS 2.2212
EPIDEMIOLOGY OF CANCER IN ADVENTISTS - A LOW RISK GROUP 2.2222
EPIDEMIOLOGY OF CANCER AMONG MORMONS 2.2259
AMERICAN CANCER SOCIETY'S PROSPECTIVE EPIDEMIOLOGICAL STUDY 2.2272
COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD 2.2320
CHILD HEALTH AND DEVELOPMENT STUDIES 2.2321
THE BERKELEY, CALIFORNIA GROWTH STUDY 2.2322
EPIDEMIOLOGICAL STUDY OF CANCER AMONGST EPILEPTICS ON ANTI-CONVULSANT DRUGS 2.2334
PRENATAL EVENTS AND CHILDHOOD CANCER 2.2338
ANALYSIS OF CAUSES OF DEATH OF VETERANS IN SOUTH AUSTRALIA AND MULTIPLE CORRELATION ANALYSIS 2.2345
ETIOLOGY AND PREVENTION OF ORAL LEUKOPLAKIAS AND THEIR MALIGNANT TRANSFORMATION 2.2364
OESOPHAGUS CARCINOMA AND THE HABITS OF SMOKING, ALCOHOL DRINKING AND 'CHIMARRAO' 2.2402
A PROSPECTIVE STUDY OF FECAL STEROIDS AND BACTERIA IN NORMAL PERSONS WHO DEVELOP CANCER OF THE LARGE BOWEL, BREAST AND ENDOMETRIUM 2.2417
SELECTION AND FOLLOW-UP OF HIGH-RISK GROUPS FOR BREAST CANCER IN THE ESTONIAN S.S.R. 2.2418
IMMUNOGENETIC AND IMMUNOLOGICAL ASPECTS OF NASOPHARYNGEAL CARCINOMA (NPC) 2.2423
CASE-CONTROL STUDY OF HIGH RISK FACTORS IN OVARIAN CARCINOMAS 2.2449
SMOKING AND CHEWING HABITS IN RELATION TO HEALTH - A PROSPECTIVE STUDY IN BOMBAY 2.2466
STUDY ON THE RELATIONSHIP BETWEEN CERVICAL CANCER AND HERPES SIMPLEX VIRUS TYPE 2 2.2484
EPIDEMIOLOGY OF MESOTHELIOMA IN DOCKYARD WORKERS IN DEVONPORT, UNITED KINGDOM 2.2490
AN INVESTIGATION INTO ORAL CANCER AND ORAL PRECANCEROUS LESIONS IN INDIAN RURAL POPULATIONS IN RELATION TO TOBACCO HABITS 2.2491
PROGNOSIS IN BRONCHIAL CARCINOMA IN A LIMITED GEOGRAPHICAL AREA IN FINLAND 2.2498
CASE-CONTROL STUDY ON THE ASSOCIATION

OF HERPESVIRUS WITH CERVICAL CANCER IN HUNGARY 2.2511
EPIDEMIOLOGICAL STUDY OF ACUTE LEUKEMIA IN ADULTS AND CHILDREN (ABBREV) 2.2521
CARCINOEMBRYONIC ANTIGEN IN AN UNSELECTED POPULATION 2.2522
PROSPECTIVE STUDIES ON CANCER EPIDEMIOLOGY BASED ON CENSUS POPULATION IN JAPAN 2.2526

ANNUAL CONFERENCES ON TRACE SUBSTANCES IN ENVIRONMENTAL HEALTH **2.1348**

CORRELATION OF WATER TRIHALOMETHANE LEVELS IN SELECTED CITIES WITH CANCER MORTALITY **2.1741**

A RETROSPECTIVE STUDY OF CANCER IN RELATION TO A SPECIFIC ENVIRONMENTAL FACTOR - WATER NITRATE **2.1890**

Pollution Types -other

EPIDEMIOLOGICAL STUDY BY ASBESTOS EXPOSURE IN CONNECTICUT **2.1269**

ASSESSMENT OF ASBESTOS EXPOSURE TO U.S. PUBLIC FROM DRINKING WATER **2.1296**

CANCER INCIDENCE IN RELATION TO ASBESTOS IN DRINKING WATER IN THE PUGET SOUND REGION **2.1315**

Radioactive Pollution

EVALUATION OF LOW LEVEL PLUTONIUM & CANCER **2.0516**

CARCINOGENIC IMPACT OF RADON IN WATER SUPPLIES **2.1106**

COMPARE OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS AMONG 12 MATCHED PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES (ABBREV) **2.1287**

GEOCHEMICAL ENVIRONMENT AND OCCURRENCE OF MALIGNANT TUMORS IN SELECTED DISTRICTS OF CZECHOSLOVAKIA **2.1576**

NATURAL BACKGROUND RADIATION AND CANCER FREQUENCY IN HUMAN POPULATION GROUPS **2.1612**

COMPARISONS OF OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS BETWEEN 12 MATCHED PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES **2.1744**

LONG-TERM STUDY OF MINERS EXPOSED TO RADON-222 **2.2307**

Sewage

ENVIRONMENTAL HEALTH SCIENCES CENTER GRANT **2.1089**

SCREEN SERA FROM AEROSOL EPIDEMIOLOGICAL STUDIES FOR ANTIBODY TO LEGIONNAIRES' DISEASE BACTERIUM **2.1311**

EPIDEMIOLOGICAL STUDY OF DISEASE ASSOCIATED WITH WASTEWATER SPRINKLER IRRIGATION **2.1317**

HEALTH RISKS OF HUMAN EXPOSURE TO WASTEWATERS **2.1319**

HEALTH ASPECTS OF RE-USE OF WASTE WATER FOR HUMAN CONSUMPTION **2.1521**

EPIDEMIOLOGICAL STUDIES OF THE RELATIONSHIP BETWEEN RE-USE OF WATER AND HAZARDS TO HEALTH **2.1693**

Trace Metals

NATIONAL MICROCONSTITUENTS **2.0098**

FOSSIL FUELS, PROCESS STREAMS AND UTILIZATION (RODENTS, RABBITS, HUMAN) **2.1063**

ENVIRONMENTAL HEALTH SCIENCES CENTER GRANT **2.1089**

HEAVY METALS AS ENVIRONMENTAL HAZARDS TO MAN **2.1097**

HEALTH EFFECTS OF HUMAN EXPOSURE TO BARIUM IN DRINKING WATER **2.1266**

ASSESSMENT OF EFFECT (BODY BURDEN AND CARDIOVASCULAR) OF CHANGE IN BOSTON WATER SUPPLY **2.1277**

CHROMOSOME STUDIES IN HUMAN SUBJECTS EXPOSED TO ARSENIC IN DRINKING WATER **2.1282**

INORGANIC ANALYSES TO SUPPORT EPIDEMIOLOGIC STUDIES **2.1305**

ANNUAL CONFERENCES ON TRACE SUBSTANCES IN ENVIRONMENTAL HEALTH **2.1348**

RELATIONSHIPS BETWEEN LEAD IN HOME DRINKING WATER, CARDIOVASCULAR RISK FACTORS AND OTHER HEALTH INDICES **2.1359**

MORTALITY AND CANCER MORBIDITY IN AN AREA SURROUNDING AN ARSENIC EMITTING SMELTERY **2.1509**

CANCER MORTALITY AND DRINKING WATER QUALITY **2.1853**

EPIDEMIOLOGICAL ASPECTS OF ASBESTOSIS AND MALIGNANT TUMORS **2.1924**

Water Quality Control

A STUDY OF CANCER AND THE PUBLIC DRINKING WATER SUPPLIES IN MISSOURI **2.1267**

Chemical Treatment

RELATION OF CANCER RATES AND SOURCE OF DRINKING WATER **2.0615**

ENVIRONMENTAL HEALTH DATA BASE FOR NEW JERSEY **2.0750**

THE EFFECT OF SCHOOL WATER FLUORIDATION ON DENTAL CARIES **2.1041**

EPIDEMIOLOGY STUDY OF HEALTH EFFECTS OF CHLORINE DIOXIDE **2.1273**

COMPARE OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS AMONG 12 MATCHED PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES (ABBREV) **2.1287**

ALTERNATE DRINKING WATER DISINFECTANT CLO2 - EVALUATION IN BETHESDA, OHIO **2.1302**

EXPOSURE TO HALOGENATED ORGANIC CHEMICALS FROM DRINKING WATER **2.1775**

Filtration

A STUDY OF THE DISTRIBUTION AND HEALTH EFFECTS OF GIARDIA LAMBLIA IN DOMESTIC WATER SUPPLY **2.1283**

ENUMERATION METHODS FOR HEALTH EFFECTS WATER QUALITY INDICATORS **2.1308**

Water Standards

DEVELOPMENT OF CRITERIA FOR WASTEWATER REUSE STANDARDS **2.0119**

THE EFFECT OF SCHOOL WATER FLUORIDATION ON DENTAL CARIES **2.1041**

HEALTH EFFECTS OF HUMAN EXPOSURE TO BARIUM IN DRINKING WATER **2.1266**

AN EPIDEMIOLOGICAL STUDY OF PRESQUE ISLAND STATE PARK BEACHES ON LAKE ERIE, ERIE, PENNSYLVANIA **2.1328**

GASTRIC CANCER AND NITRATE INGESTION - NITRATE IN DRINKING WATER **2.1696**

WATER TYPES

Fresh Water

THE INVESTIGATION OF NATURAL 222RN AND 225RA IN GROUNDWATER IN MAINE AND ADJACENT AREAS AND ASSESSMENT OF RELATED HEALTH EFFECTS **2.1236**

Ground Water

RELATION OF CANCER RATES AND SOURCE OF DRINKING WATER **2.0615**

CARCINOGENIC IMPACT OF RADON IN WATER SUPPLIES **2.1106**

CHROMOSOME STUDIES IN HUMAN SUBJECTS EXPOSED TO ARSENIC IN DRINKING WATER **2.1282**

COMPARE OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS AMONG 12 MATCHED PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES (ABBREV) **2.1287**

WATER SOURCES AND CHARACTERISTICS AND RISK OF MALIGNANCIES OF SELECTED SITES IN SELECTED LOUISIANA PARISHES **2.1792**

A RETROSPECTIVE STUDY OF CANCER IN RELATION TO A SPECIFIC ENVIRONMENTAL FACTOR - WATER NITRATE **2.1890**

Irrigation Water

DISEASE TRANSMISSION ASSOCIATED WITH LAND APPLICATION OF WASTEWATER **2.1263**

EPIDEMIOLOGICAL STUDY OF DISEASE ASSOCIATED WITH WASTEWATER SPRINKLER IRRIGATION **2.1317**

ANALYSIS OF URINES FOR NITROSAMINES FROM PATIENTS WITH BILHARZIASIS **2.2442**

Potable Water

EVALUATION OF ORGANIC COMPOUNDS WITH MUTAGENIC AND CARCINOGENIC PROPERTIES PRESENT IN DRINKING WATER **2.0066**

DEVELOPMENT OF CRITERIA FOR WASTEWATER REUSE STANDARDS **2.0119**

RELATION OF CANCER RATES AND SOURCE OF DRINKING WATER **2.0615**

U.S. CANCER MORTALITY SURVEY **2.0702**

BLADDER CANCER IN NEW HAMPSHIRE, VERMONT, AND MAINE **2.0734**

ENVIRONMENTAL HEALTH DATA BASE FOR NEW JERSEY **2.0750**

THE EFFECT OF SCHOOL WATER FLUORIDATION ON DENTAL CARIES **2.1041**

ENVIRONMENTAL HEALTH SCIENCES CENTER GRANT **2.1089**

CARCINOGENIC IMPACT OF RADON IN WATER SUPPLIES **2.1106**

ARE PUBLIC AND RECREATIONAL WATER SUPPLIES IN MONTANA SAFE FROM YERSINIA ENTEROCOLITICA GASTROENTERITIS **2.1235**

THE INVESTIGATION OF NATURAL 222RN AND 225RA IN GROUNDWATER IN MAINE AND ADJACENT AREAS AND ASSESSMENT OF RELATED HEALTH EFFECTS **2.1236**

RELATIONSHIP OF SODIUM AND OTHER INORGANIC CONSTITUENTS IN DRINKING WATER TO HYPERTENSION IN CONNECTICUT **2.1259**

HUMAN HEALTH HAZARDS OF VIRUSES IN DRINKING AND RECREATIONAL WATERS **2.1261**

HEALTH EFFECTS OF HUMAN EXPOSURE TO BARIUM IN DRINKING WATER **2.1266**

A STUDY OF CANCER AND THE PUBLIC DRINKING WATER SUPPLIES IN MISSOURI **2.1267**

EPIDEMIOLOGIC STUDY OF BLADDER CANCER RISK ASSOCIATED WITH TRIHALOMETHANES IN DRINKING WATER **2.1268**

A STUDY OF CANCER AND THE PUBLIC DRINKING WATER SUPPLIES OF MISSOURI **2.1271**

EXPLORATORY EPIDEMIOLOGIC STUDY OF POSSIBLE RELATIONSHIPS OF DRINKING WATER QUALITY TO BIRTH DEFECTS AND SPONTANEOUS ABORTIONS **2.1272**

EPIDEMIOLOGY STUDY OF HEALTH EFFECTS OF CHLORINE DIOXIDE **2.1273**

HEALTH CONSEQUENCES OF BENZENE CONTAMINATION OF DRINKING WATER **2.1274**

STUDY OF EFFECTS OF HOME WATER SOFTENERS ON BLOOD PRESSURES OF SCHOOL AGE CHILDREN - OHIO **2.1275**

DETERMINE IF DRINKING WATER PLAYS A RISK IN THE DEVELOPMENT OF NEUROLOGIC DISEASES **2.1276**

ASSESSMENT OF EFFECT (BODY BURDEN AND CARDIOVASCULAR) OF CHANGE IN BOSTON WATER SUPPLY **2.1277**

HEALTH EFFECTS OF ENERGY BYPRODUCTS ON DRINKING WATER **2.1278**

CHROMOSOME STUDIES IN HUMAN SUBJECTS EXPOSED TO ARSENIC IN DRINKING WATER **2.1282**

A STUDY OF THE DISTRIBUTION AND HEALTH EFFECTS OF GIARDIA LAMBLIA IN DOMESTIC WATER SUPPLY **2.1283**

COMPARE OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS AMONG 12 MATCHED PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES (ABBREV) **2.1287**

GEOGRAPHIC DISTRIBUTION OF CARDIOVASCULAR DISEASE MORTALITY AND CONSTITUENTS OF DRINKING WATER **2.1288**

RETROSPECTIVE EPIDEMIOLOGIC STUDY OF HEPATITIS A AND WATER QUALITY **2.1292**

ASSESSMENT OF ASBESTOS EXPOSURE TO U.S. PUBLIC FROM DRINKING WATER **2.1296**

ALTERNATE DRINKING WATER DISINFECTANT CLO2 - EVALUATION IN BETHESDA, OHIO **2.1302**

INVESTIGATION OF WATERBORNE DISEASE OUTBREAKS **2.1304**

INORGANIC ANALYSES TO SUPPORT EPIDEMIOLOGIC STUDIES **2.1305**

ANNUAL REVIEW OF WATERBORNE DISEASE OUTBREAKS **2.1310**

IDENTIFICATION AND PREVALENCE OF YERSINIA ENTEROCOLITICA IN WASHINGTON STATE WATER SUPPLIES **2.1313**

CANCER INCIDENCE IN RELATION TO ASBESTOS IN DRINKING WATER IN THE PUGET SOUND REGION **2.1315**

DETERMINATION OF MINIMAL HUMAN INFECTIOUS DOSE OF AN ENTEROVIRUS IN DRINKING WATER **2.1320**

IDENTIFICATION AND EVALUATION OF WATERBORNE EXPOSURE ROUTES TO HUMANS FROM OTHER THAN FOOD AND DRINKING WATER **2.1333**

RELATIONSHIPS BETWEEN LEAD IN HOME DRINKING WATER, CARDIOVASCULAR RISK FACTORS AND OTHER HEALTH INDICES **2.1359**

INVESTIGATION OF CERTAIN MEDICAL IMPLICATIONS OF AN IODINATED WATER SUPPLY **2.1364**

HEALTH ASPECTS OF RE-USE OF WASTE WATER FOR HUMAN CONSUMPTION **2.1521**

RELATIONSHIP BETWEEN LEVELS OF NITRATE IN DRINKING WATER AND CANCER MORTALITY **2.1554**

GEOCHEMICAL ENVIRONMENT AND OCCURRENCE OF MALIGNANT TUMORS IN SELECTED DISTRICTS OF CZECHOSLOVAKIA **2.1576**

GASTRIC CANCER AND NITRATE INGESTION - NITRATE IN DRINKING WATER **2.1696**

COMPARISONS OF OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS AMONG PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES IN OHIO **2.1743**

COMPARISONS OF OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS BETWEEN 12 MATCHED PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES **2.1744**

A STUDY OF CANCER AND THE PUBLIC DRINKING WATER SUPPLIES IN MISSOURI **2.1758**

EXPOSURE TO HALOGENATED ORGANIC CHEMICALS FROM DRINKING WATER **2.1775**

SURVEILLANCE OF CANCER MORBIDITY IN DULUTH, MINNESOTA **2.1776**

WATER SOURCES AND CHARACTERISTICS AND RISK OF MALIGNANCIES OF SELECTED SITES IN SELECTED LOUISIANA PARISHES **2.1792**

CANCER MORTALITY AND DRINKING WATER QUALITY **2.1853**

CANCER MORTALITY IN THE LAST TWENTY YEARS IN SPECIFIC COUNTIES AND CITIES OF MINNESOTA **2.2057**

ENVIRONMENTAL INFLUENCES ON CANCER MORBIDITY IN THE PITTSBURGH REGION **2.2202**

CANCER INCIDENCE IN RELATION TO ASBESTOS IN DRINKING WATER IN THE PUGET SOUND REGION **2.2317**

RETROSPECTIVE STUDY OF LEUKAEMIAS, LYMPHOMAS AND OTHER HEMATOLOGICAL NEOPLASMS **2.2481**

Surface Water

EVALUATION OF ORGANIC COMPOUNDS WITH MUTAGENIC AND CARCINOGENIC PROPERTIES PRESENT IN DRINKING WATER **2.0066**

HUMAN HEALTH HAZARDS OF VIRUSES IN DRINKING AND RECREATIONAL WATERS **2.1261**

COMPARE OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS AMONG 12 MATCHED PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES (ABBREV)

2.1287

DESCRIPTION OF RESEARCH PROJECTS

3.0001,

THE RELATIONSHIP BETWEEN CARCINOGENESIS AND DNA REPAIR IN XERODERMA PIGMENTOSUM HETEROZYGOTES

M.A. Ritter, University of Pennsylvania, School of Medicine, Dept. of Radiation Therapy, *36th & Hamilton Walk, Philadelphia, Pennsylvania* 19174 (CD-49)

Ultraviolet light-induced DNA repair rates will be measured in a number of fibroblast lines that are obligate heterozygotes for xeroderma pigmentosum (XP). XP is a skin-cancer-prone, autosomally recessive human disease. Homozygotes for XP are defective in repairing UV-induced DNA damage.

Our preliminary results, obtained using an M. luteus endonuclease assay for DNA repair, indicate reduced repair, relative to normals, in all 8 obligate XP heterozygote lines that we have tested. In addition, a reduced repair rate was found in one unaffected sibling of an XP family. These heterozygotes include representatives of complementation groups A through D, as well as several unclassified lines.

We will extend our study to 15-20 additional heterozygote lines. We will measure: excision resynthesis with BND-cellulose chromatography, removal of endonuclease-sensitive sites, repair of N-acetoxy-2-acetyl-aminofluorene (AAAF) induced DNA damage and, in obligate heterozygote parents of XP 'variants', we will measure levels of post-replication repair.

Our goals are to: 1) further document the existence of DNA repair deficiencies in XP heterozygotes. 2) Compare repair rates in heterozygotes with skin cancer frequencies in blood relatives. This skin cancer data is now available from studies by Dr. M. Swift of skin cancer frequencies in XP families. 3) Investigate aspects of the genetic complexity of XP through analysis of intrafamilial variations in repair. Our results may promote a clearer understanding of the role of DNA repair genes in human carcinogenesis.

ETIOLOGICAL STUDIES OF HUMAN BREAST CANCER

D.H. Moore, Hahnemann Medical College & Hospital, Medical College, Dept. of Microbiology & Immunology, *235 N. 15th St., Philadelphia, Pennsylvania* 19102 (RDP-34B)

OBJECTIVE: To obtain demographic data, personal data (body build, reproduction physiology, sex life, drug use) living conditions, diet, personal attitudes, and response styles of three different populations in South Africa: (1) rural Zulu women with zero incidence of breast cancer; (2) urban Zulu women with an appreciable incidence; and (3) urban white women with a high incidence of breast cancer.

APPROACH: Three to four hundred women of each group will be interviewed at length to gain answers to a standard questionnaire which will be analyzed by computer. Breasts will be examined for dysplasia and fluids extracted from as many as possible. Nipple fluids from women of each group will be collected on dry ice and tested for mutagens/carcingens by the Ames method. Some of the fluids will be tested for prostaglandins and other hormones.

PRESENT PROGRESS: More than 1,100 interviews have been made and fluids have been taken from more than 100 women. The results look interesting and significant but have not yet been analyzed.

CURRENT PLANS: To analyze data in detail and test the specimens

HERPESVIRUS TYPE-2-SPECIFIC ANTIBODIES IN CERVICAL CANCER CASE-CONTROL STUDIES

G.R. Dreesman, Baylor College of Medicine, School of Medicine, Dept. of Virology & Epidemiology, *1200 Moursund Ave., Houston, Texas* 77025 (IM-272)

It has been more than 10 years since herpes simplex virus type 2 (HSV2) was first associated with human cervical carcinoma by seroepidemiological studies. However, the methodology available for these studies produced equivocal results because of the major antigenic cross-reaction expressed between HSV1 and HSV2. Recently, our laboratory developed a micro solid phase radioimmunometric assay (micro-SPRIA) which allows for testing of human sera for type-specific HSV antibody utilizing purified HSV type-specific glycoproteins. We propose to utilize this assay to screen a well-documented case-control bank of sera available in this laboratory. More than 4000 sera are available in the serum bank. The representative antibody status of each patient, as determined by the micro-SPRIA test, will be analyzed to ascertain whether patients with past HSV2 infections have a greater risk of developing cervical cancer than matched controls. Sera from different geographical areas will be studied to determine if HSV2 is the prevalent agent in conjunction with cervical cancer in different populations. Lastly, purified glycoproteins from different HSV2 strains isolated will be studied to determine if possible serological variations between study groups are associated with the origin of the strains.

IA-LIKE ALLOANTIGENS ON HUMAN T CELLS

W.C. DeWolf, Sidney Farber Cancer Center Inc., Dept. of Immunogenetics, *44 Binney St., Boston, Massachusetts* 02115 (IM-235)

The objective of this proposal is to confirm and characterize the presence of Ia-like alloantigens on human T cells by two distinct approaches that are operational within this laboratory. The first approach utilizes HLA alloantisera and p29,34 heteroantiserum to identify Ia-like determinants which we have shown and described to exist on activated T cells. The second approach will identify T cell Ia-like alloantigens that stimulate in MLC. The determinants identified by each of these two approaches will be defined in terms of genetic characteristics, functional analysis, and disease modification. Genetic characterization will include studies to determine HLA-linkage as well as large population analysis to determine allotype specificity. Assays to determine 'Ia-like' antigen associated functions will include various in vitro cell mediated immune functions including MLC, cell mediated lympholysis (CML), primed lymphocyte typing (PLT), antibody dependent cell mediated lymphocytotoxicity (ADCC), natural killing (NK), third party suppression in MLC, lymphocyte mitogenic factor production (LMF), and macrophage dependent T lymphocyte activation. Studies to examine disease modification of newly defined antigens will involve the identification of antigens and antigen frequency with selected patient populations including testicular cancer, lymphomas and leukemias.

Preliminary experiments on T cell stimulation within a single 6-member recombinant family have identified the existence of a non-HLA MLC stimulation locus which requires HLA-B,D identity between responder and stimulator to occur (similar to Mls locus in the mouse).

We expect that amplification of our preliminary findings will lead to the characterization of new Ia-like determinants on human T cells and that the identification of such determinants may provide the proper information to allow submapping of the HLA-D region.

3.0005,

MINERAL FIBERS AND LUNG CANCER

A.M. Churg, University of California, San Francisco Campus, School of Medicine, Dept. of Pathology, *551 Parnassus Ave., San Francisco, California* 94122 (PDT-146)

Epidemiologic studies of lung cancer indicate that there are marked incidence variations which cannot be accounted for by cigarette smoking patterns, but do appear to relate to variables such as race, socioeconomic status, and geographic location. Air pollution is another factor which has sometimes been implicated in lung carcinogenesis, primarily on the basis of urban vs. rural cancer rates. Mineral fibers constitute a portion of the particulate fraction of urban air pollution, and it has been shown in animal studies that, under appropriate conditions, many particulates and especially mineral fibers may be carcinogenic or co-carcinogenic. Mineral fibers are known to be present in large numbers in the lungs of urban dwellers. This research involves an investigation to determine if there is an association between lung burden of fibrous minerals and bronchogenic carcinoma in a general urban population in a geographically high lung cancer area. Numbers of mineral fibers will be quantitated at the light and electron microscopic level by dissolving autopsy and surgical lungs and collecting appropriate samples. Whole lung slices will be used to minimize topographic variation in numbers of fibers. Fibers will be further identified by electron diffraction and electron microprobe to determine mineral species, and will also be enumerated by lengths and diameters; the latter properties appear to be important in carcinogenesis. An attempt will be made to correlate total fibers, fiber specific mineral type, and/or fibers of various size classes with the presence or absence of bronchogenic carcinoma.

3.0006,

TRANSFORMATION OF LYMPHOCYTES BY EPSTEIN-BARR VIRUS

E. Kieff, University of Chicago, Pritzker School of Medicine, Dept. of Medicine, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (FRA-206)

The objective of this program is to understand the mechanisms by which Epstein-Barr virus transforms human lymphocytes. Related objectives include an analysis of viral functions in human Burkitt's tumor tissue and studies of the molecular epidemiology of Epstein-Barr virus. Proposed projects include: (1) Studies of the structure of viral DNA, (2) analysis of whether viral DNA is integrated into cellular DNA in transformed cells, (3) mapping of proteins encoded by viral DNA in transformed cells, (4) studies of the synthesis and processing of viral RNA in transformed cells and Burkitt's tumor tissue, (5) determination of whether there are specific binding site(s) in EBV DNA for EBNA, and (6) analyses of viral protein in transformed cells.

FACULTY RESEARCH AWARD (APPLICATION)

A.S. Morrison, Harvard University, Boston Campus, School of Public Health, Dept. of Epidemiology, *55 Shattuck St., Boston, Massachusetts* 02115 (FRA-208)

This is a proposal for a five-year program of research in cancer epidemiology. Projects are planned in three areas: etiology, screening, and natural history. In the area of etiology, studies will be made of cancer of the breast and cancer of the urinary bladder. Studies of breast cancer will focus on a) the relationship of breast parenchymal pattern to both breast cancer risk factors and incidence, and b) the hormonal correlates of parenchymal pattern. For bladder cancer, a detailed analysis will be made of the relationship of incidence to occupational hazards. The work on screening will involve development of basic methods in the areas of program evaluation (especially of late outcomes), cost-efficiency, and characteristics of screen-detected cancer. The last topic includes measurement of lead time, length bias, and the timing of metastasis formation in relation to the time of diagnosis by screening. The studies of natural history involve two approaches. The first will be a 'descriptive' evaluation of rates of metastasis formation for several common cancers. The second approach will be the analysis of the development of metastases in relation to incidence risk factors, for primary cancers of the breast and bladder.

SUPPORTED BY American Cancer Society Inc. $31,000

3.0008,

MORBIDITY AND MORTALITY AMONG PHOSPHATE MINERS

G.M. Matanoski, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (JHU 33434)

The purpose of this study is to determine whether there is an excess all-cause and cancer morbidity and mortality among employees of central Florida phosphate mining company. If such an excess is found, further objective is to attempt to determine a job site or job title which may be associated with the excess. A primary hypothesis is that such an excess may exist due to worker radiation exposure from uranium and daughter products found in phosphate rock.

The approach is nonconcurrent prospective, in which all employees since 1950 are identified, and their outcomes determined. Mortality is ascertained by means of Social Security Administration records and death certificates. Morbidity is ascertained by means of questionnaries and medical record searches. Additional information will be sought from the employees regarding such factors as smoking history, diet, and exposures to other potentially carcinogenic agents or jobs.

An additional aspect of the study involves whole-body radiation counting on a small number of current long-term employees, to determine whether there is evidence of a body burden of radioactive materials.

LIPOPROTEINS AND BLOOD PRESSURE IN CONTRASTING POPULATIONS

G.E. Fraser, Loma Linda University, School of Health, Dept. of Biostatistics & Epidemiology, *Loma Linda, California* 92354 (80 826)

This study will compare lipoprotein levels and blood pressures on 150 Seventh-day Adventists and 150 nonAdventist neighborhood controls. These will be males ages 35-55 years. A questionnaire will also document a simple dietary history, cigarette smoking, alcohol consumption, and leisure time physical activity.

The effect of the Adventist lifestyle on lipids and blood pressure will then be evaluated. As Adventists have a largely vegetarian diet, and do not smoke or drink alcohol, some differences are anticipated. Simple tests and regression techniques will be used in analysis.

Over the last few decades, interest has grown regarding the potential for preventing coronary heart disease by lifestyle change. The Adventist population has considerable potential for providing useful data concerning the important components of lifestyle, as they have a documented low risk of cardiac death. Presumably, this is related to their lifestyle.

CHRONIC CARRIERS OF SALMONELLA TYPHI IN PATIENTS WITH CARCINOMA OF THE GALLBLADDER

J.L. Rios Dalenz, Caja Nacional de Seguridad Social, *Casilla de Correos 697, c/o Hospital No. 1, La Paz, Bolivia*

There is epidemiological evidence of increased mortality due to hepatobiliary cancer in chronic carriers of Salmonella typhi in the general population. In La Paz there is a high incidence shown in the La Paz Cancer Registry of gallbladder carcinoma; also typhoid fever is considered to be endemic in this area.

The presence of Salmonella typhi will be determined by cultures of bile and feces in all patients with unresected gallbladder carcinoma.

There will also be a control group. The project is expected to run two years, depending on the number of patients that are found with gallbladder carcinoma. (Translated)

TUMORS OF CHILDHOOD IN EGYPTIAN CHILDREN - EPIDEMIOLOGICAL AND STATISTICAL STUDIES

S.G. Boutros, Cancer Registry for the Metropolitan Cairo Area, *Tharwat St., P.O.B. 1017, c/o Cairo University, Dokki, Cairo, Egypt*

OBJECTIVE: Assess statistically as far as possible the magnitude of childhood cancer in Egyptians below the age of 20.

APPROACH: (a) 670 cancer cases below the age of 20, reported to the Cancer Registry for the Metropolitan Cairo area during the period 1973-1975, were studied. (b) Reported deaths among those under 20 years of age in the period 1933-1972 were analyzed.

PROGRESS AND RESULTS: a. Cancer in the age period 0-19 constituted 7.94% of the total cancer in all age groups, with male preponderance, M:F ratio 1.8. b. The five most prevalent tumor sites in childhood are: malignant tumors of lymph nodes (29.1%); malignant tumors of bone and joints (20.0%); hematopoietic and reticuloendothelial system (12.8%); malignant tumors of the eye and the central nervous system (11.3%); and malignant tumors of connective and soft tissue (6.0%). c. The order of the frequency of histological typing is as follows: lympho-hematopoietic tissue ranks first (36.72%), followed by sarcoma (33.13%), carcinoma (13.17%) and nervous tissue tumors (9.85%). d. Childhood cancer death rate rose from 0.17 per 100,000 population in 1930 to 3.37 in 1970.

The main concern of the study is some of the most common forms of cancer in Egyptian children, such as Hodgkin's disease, malignant tumors of the bones, leukemias, and tumors of the central nervous system.

BACTERIA AND THE ETIOLOGY OF CANCER

R.R. Williams, Central Public Health Lab., B M R Laboratory, *Colindale Ave., London NW9 5DX, England, United Kingdom* (SP 1386)

OBJECTIVE: To determine the role of bacterial metabolites in the causation of human cancer, particularly of the large bowel.

APPROACH: Having completed a case-control study, we are now carrying out prospective studies of the value of fecal bile acid concentration and the presence of certain clostridia in characterizing persons at high risk of developing colorectal cancer. The study groups include a group of 8,000 normal healthy persons aged 45-75, and various high risk patient groups.

A team of chemists is examining the factors controlling production of unsaturated bile acids and is isolating and characterizing minor fecal bile acids.

The effect of diet on fecal analysis and the composition of ileostomy fluid are being studied; from these two sets of data (which give an indication of what enters the colon and what metabolites are produced from it during bowel transit) we hope to obtain a better understanding of the bacterial reactions taking place in the colon.

PROGRESS: In the prospective study of 'normal' persons, the population has been assembled and the first cases are currently being analyzed.

GENETICALLY DETERMINED OXIDATION STATUS AND THE OCCURRENCE OF CARCINOMA AMONG NIGERIANS AND U.K. CAUCASIANS

J.R. Idle, University of London, St. Marys Hospital Medical School, Dept. of Pharmacology, *Norfolk Pl., London W2 1PG, England, United Kingdom* (SI 2016/PHARMACOL 1)

OBJECTIVE: To determine whether or not a defined inherited metabolic oxidative factor influences susceptibility to carcinoma associated with chemical carcinogens.

APPROACH: An individual may be phenotyped for his/her ability to effect the metabolic oxidation of a number of drugs. Two major phenotypes exist in the human population, the so-called extensive metabolizer (EM) and poor metabolizer (PM) phenotypes. In U.K. caucasians, the frequency of these two traits is approximately 90 and 10 percent respectively. By phenotyping populations of patients with various primary tumours, using simple urine analysis, it should be possible to evaluate, with respect to controls, the role of this single gene in the epidemiology of these tumours. Since chemical carcinogenesis frequently involves a step within the tissues to create the ultimate carcinogens, the hypothesis demands that the most rapid oxidizers appear more frequently in cancer patient samples compared to control populations.

PROGRESS: For progress see Hetzel, et al., (1980) Thorax; 35: 709. and Idle, et al. (1980) Cancer Letters, in press.

3.0015,

BLADDER CANCER AND THE PRINTING INDUSTRY - AN HISTORICAL PROSPECTIVE MORTALITY STUDY OF THE PRINTING INDUSTRY

D. Leon, University of London, London School of Hygiene & Tropical Medicine, Dept. of Epidemiology, *Keppel St., London WC1E 7HT, England, United Kingdom* (SP 1572)

OBJECTIVE: To investigate whether print workers have an increased risk of dying from cancer of various sites, especially bladder cancer, compared to members of the general population.

APPROACH: The study is of a prospective kind. Approximately 7-9000 print workers who were employed in the industry in a variety of occupations between 1949 and 1963 are being identified from the membership records of two printing trade unions. It will then be ascertained, with the assistance of the Office of Population Censuses and Surveys, whether any of them have since died and if so their cause and date of death.

Sex, date of birth, details of occupation on entry into the union, major occupation changes subsequent to entry while remaining in the union, duration and period of union and branch membership, firm on entry into branch and other relevant information is also being collected from union records. On the basis of this information the risks of dying from various causes within the different occupational groups will be examined and compared. Duration of 'exposure', measured in terms of length of full membership, will also be examined in relation to risk, to see if any dose-response type relationships can be established.

If a significantly increased risk is found for cancer of the bladder, or any other site, the analysis of the deaths from that cause may be extended by carrying out a case-control study. This would allow a more detailed examination of the relationship between type and duration of exposure to risk.

A STUDY OF THE PATHOLOGY OF RADIOLOGICALLY PROMINENT DUCTS AND THEIR SIGNIFICANCE IN PREDICTING FUTURE BREAST CANCER RISK

R.E. Mansel, University of Wales, Welsh National School of Medicine, University Hospital, Dept. of Surgery, *Heath Park, Cardiff CF1 1XP, Wales, United Kingdom* (SP 1337/3)

OBJECTIVE: To determine the pathological basis for the mammographic appearance known as the prominent duct (Wolfe) pattern and to test the hypothesis that this pattern is a predictor of future breast cancer risk.

APPROACH: Mastectomy specimens containing ducts are radiographed after removal and sliced into sections 400 microns thick mounted on paper for macroscopic study. Areas showing density on radiography are taken for microradiography and histological study. Microradiography is performed on the Softex CMR X-ray unit and the microradiograph is examined under an optical microscope. Areas of microdensity are stained with collagen and elastic stains for histological study.

Secondly, the mammograms of all patients seen in the Cardiff Breast Clinic are prospectively classified according to the Wolfe hypothesis (Wolfe J.N., Cancer 37: 2486, 1976). The classification and data on known risk factors for breast cancer are entered into a computer program which will be updated yearly by postal follow-up. After 5 years, all patients will be recalled for a clinical and mammographic

review to determine the predictive accuracy of the prominent duct pattern for breast cancer.

PROGRESS: A pilot study has shown that several pathological entities can give rise to densities described as the prominent duct pattern with no clear-cut division between radiological sub-groups (R.E. Mansel, I.H. Gravelle and L.E. Hughes, Brit. J. Surg. 66:701, 1979).

A NATIONAL PROSPECTIVE STUDY OF SOCIO-DEMOGRAPHIC DIFFERENCES IN CANCER INCIDENCE AND SURVIVAL

A.J. Fox, City University, Dept. of Mathematics, *St. John St., London EC1V 4PB, England, United Kingdom* (SP 1602)

The study will use data derived from the Office of Population Censuses and Surveys Longitudinal Study, which covers approximately one percent of the population of England and Wales, to analyze and describe the relationships between socio-demographic characteristics of the population and cancer incidence in 1971-75 (and subsequently in 1976-80). In addition, it would consider, for those cases registered as having cancer in 1971-75, the relationships between survival after cancer registration and socio-demographic characterization in 1971 (the starting point of the longitudinal study).

EVALUATION AND ANALYSIS OF CIRCULATING IMMUNE COMPLEXES IN NEOPLASTIC PATIENTS

P. Casali, Universita degli Studi di Genova, Dept. of Immunology, *Viale Benedetto XV, 10, 16132 Genoa, Italy*

Circulating immune complexes (CIC) are found in high concentration in the serum of patients with collagen, kidney and liver diseases. Several reports have shown that also in several tumor and leukemia patients CIC levels are abnormally elevated. The present project tackles the question in a broad manner, in its methodological, epidemiological and analytical aspects. First, our methodological approach is based on the observation that no single available method for the detection of CIC can assess all complexes because each method sees different aspect of the complex and complexes are qualitatively different in different pathological situations. In consequence, we have developed a new method where several recognition units can be utilized. An enzyme-anti-enzyme complex (probe) competes with the CIC for binding sites in the recognition unit (conglutinin, C1q or rheumatoid factor) and the end-point is a reading of bound enzyme activity. This method is presently being used on a medium scale and its results are being critically evaluated. Second, a certain number of homogeneous groups of patients are selected and CIC determinations are performed (together with the monitoring of a number of immunological parameters such as serum complement levels, lymphocyte stimulability by mitogens, efficiency of NK cells) in close cooperation with clinical teams in the Genoa and Pisa area. The selected groups are: a) lung carcinoma (a follow-up of operated patients with randomized treatments has been set up); b) intestinal tumors; c) lymphomas (Hodgkin's and non-Hodgkin's); d) leukemias; e) African nasopharyngeal carcinoma positive for Epstein-Barr virus (EBV).

Third, the analysis of CIC will be done after isolation from large batches of high titered serum. The antibody and antigen will be studied separately; the latter will be tested for the presence of MHC products and for tumor specific viral antigens or virus-determined cellular antigens (as in the typical case of nasopharyngeal carcinoma complexes). Eventually both isolated ab and antigen moieties may be utilized as specific reagents.

GLOBAL EVALUATION OF 'OFF THERAPY' LEUKEMIC CHILDREN

G. Masera, Universita degli Studi di Milano, Clinica Pediatrica, *Via Commenda 9, 20122 Milan, Italy* (80.01585.96)

OBJECTIVE: A prospective study of the clinical conditions of leukemic children who are off therapy. The project is composed of several segments: neuropsychological evaluation, including CAT, EEG, IQ, and behavioral evaluation; endocrinological evaluation; study of testis histomorphology, histoenzymology and ultrastructure; histological, biochemical and immunological evaluation of liver function.

During the first phase of the study (in progress) more than 70 children followed up at the Clinica Pediatrica of Milan will be examined. Later, several other Italian centers will be included in the project.

A national epidemiological study of 'off-therapy' children affected with several types of tumors is in progress.

THE ROLE OF CARCINOGENIC CHEMICALS IN INDUCING PRIMITIVE BRAIN NEOPLASMS - A CASE-CONTROL STUDY

G. Morello, C. Besta Neurological Inst., *Via Celoria n.11, 20133 Milan, Italy* (80.02303.96)

The aim of the study is to estimate the relationship between the occupational exposure to carcinogenic chemicals and brain neoplasms. The research is an analytic epidemiological case-control study. All patients with histologically or radiologically confirmed brain neoplasms and all controls are interviewed about occupational history, amounts of tobacco smoked and alcohol consumed. Hospital control patients for each case are matched by sex, age and residence.

From preliminary data, obtained on 51 cases of glioma and their matched controls, we have shown an increased Relative Risk (RR) for gliomas among farmers. The RR is doubled (RR equals 8 (95 percent confidence limits: 1.4-45.9)) for farmers working after 1960; this fact suggests some relationship with pesticides and/or fertilizers which have been heavily used in Italy only in the last 20 years.

Based on this hypothesis, we have begun from Novermber 1980 to use a questionnaire more focused on the chemicals used in farming, trying to transform occupational data in exposure histories.

EVALUATION OF THE CASE-CONTROL APPROACH FOR THE MONITORING OF OCCUPATIONAL CANCER RISKS

F. Berrino, Istituto Nazionale per lo Studio e la Cura dei Tumori, *1 Via G Venezian, 20133 Milan, Italy*

OBJECTIVE: The objective of the study is to reexamine a number of case-control studies which have aready been conducted on respiratory cancers and to analyze with a case-control type methodology the occupational data routinely collected by the Varese province cancer registry and by other health information systems in order to verify if the case-control approach may be of value for the identification of occupational carcinogens and for the evaluation of the proportion of disease caused by occupational exposure.

APPROACH: In occupational epidemiology the prospective approach (cohort studies) has been much more extensively used than the retrospective (case-control) one. The main disadvantage of the latter is the rarity of many occupations one might be interested in, so that the size of the study has to be very large to detect meaningful differences. On the other hand the results of a prospective study conducted on a single cohort of workers cannot be easily extrapolated to other working conditions; in particular population attributable risks cannot easily be estimated. In case-control studies the obstacle of the rarity of occupations may be overcome by grouping together all those who are exposed to the same risk factor(s); if both certain and possible exposures are grouped, the relative risk will be underestimated but, if the sensitivity of the categorization of the exposure is sufficiently high, a reliable estimate of the attributable risk is still possible even if the specificity is low. In the computation of the attributable risk, in fact, the underestimation of the relative risk may be satisfactorily balanced by the contemporary overestimation of the prevalence of the exposure in the population.

MONOOXYGENASE LEVELS AND URINARY MUTAGENESIS IN CHEMICAL WORKERS

G. Maltoni, Centro per lo studio e la prevenzione oncologica, *Viale Alessandro Volta 171, 50131 Florence, Italy* (800228796)

OBJECTIVES: Define to what extent the exposure to foreign chemicals varies the metabolism and the activation of environmental carcinogens. Determine the presence of potentially carcinogenic chemicals in the body fluids of workers exposed to mutagenic chemicals in the work place.

APPROACH: Parameters of monooxygenase activity in men will be measured with indirect methods (antipyrine half life, glucaric acid excretion, ratio between 6-beta-hydroxycortisol/17 hydroxycorticosteroids), and urinary mutagens will be monitored with the Salmonella-microsome assay.

PROGRESS: Preliminary observation indicates that chemical workers show an increase of glucaric acid excretion, whereas N-demethylase activity is often reduced. Smokers have a higher concentration of urinary mutagens than non-smokers. Chemical workers have mutagens in their urine even when they do not smoke.

3.0024,

EPIDEMIOLOGICAL MODELS FOR THE STUDY OF ENVIRONMENTAL CARCINOGENESIS

E. Terracini, Universita degli Studi di Torino, Dept. of Epidemiologia dei Tumori, *Via Santena 7, 10126 Turin, Italy* (80.02312.96)

OBJECTIVES: 1) To estimate the population attributable risk determined by several etiological factors for cancer of the urinary tract and other sites; 2) to study the mechanisms of interactions between different etiological agents in carcinogenesis.

APPROACH: The design is that of case-control studies. Cases of cancer of the urinary tract are male residents in the Province of Torino. They are contacted and interviewed in the three main hospital urological wards of the Province. Each case is sex- and age-matched with a hospital control from the same urological ward (excluding cancer at any site, cystitis and haematurias of unknown origin). Information is collected on smoking habits, coffee consumption, use of analgesics and artificial sweeteners and occupational history throughout life. A further control group is represented by a random sample of residents in the city of Torino. During 1980, 92 such controls were interviewed. Other sites to be investigated in a similar way are cancer of the larynx and cancer of the mouth.

PROGRESS: Data regarding occupational and smoking histories of the first 225 pairs (bladder cancer case-hospital control) have been analyzed. Age-standardized relative risks associated with tobacco smoke were 4.8 for all smokers and 2.5, 6.1 and 7.1 respectively for smokers of 1-9, 10-19 and 20 plus cigarettes/day. The relative risk associated with occupations known to have an etiological role in cancer of the urinary tract (lasting at least 6 months in any life period) was 1.8. Relative risks determined by cigarette smoke were also estimated separately in persons occupationally exposed and non-occupationally exposed. The comparison suggests a multiplicative effect.

PULMONARY FUNCTION TESTS IN ADOLESCENTS AND THEIR PARENTS - AN EPIDEMIOLOGIC APPROACH

B.J. van den Berg, University of California, Berkeley Campus, School of Public Health, Dept. of Biomedical & Environmental Health Sciences, *Berkeley, California* 94720 (1171R2)

This is a continuation of an epidemiologic study, whose research aims for this year are: (1) Evaluation of the effect of parents' smoking habits on health and morbidity of infants and young children. (2) Evaluation of the effect of parents' smoking on physical and cognitive development at the age of 5 years, 10 years, and 15 years. (3) Evaluation of interrelationship of morbidity, especially of the respiratory system, in childhood to subsequently established smoking habits and to the functional capacity of the lungs in adolescence. (4) Evaluation of the relationship between cigarette smoking and lung function test, blood pressure, and physique. (5) Identification of biosocial and behavioral factors that influence the decision to start smoking, to maintain the smoking habit and to quit smoking among a large cohort of parents and their children.

RELATIONSHIP OF LOWER RESPIRATORY TRACT DISEASE IN INFANCY TO THE DEVELOPMENT OF CHRONIC LUNG DISEASE IN ADULTS

C.B. Hall, University of Rochester, School of Medicine & Dentistry, Dept. of Pediatrics/Medicine, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (1164R2)

OBJECTIVE: To prospectively determine the long-term effect of lower respiratory tract disease from respiratory syncytial virus (RSV) during infancy and its relation to the possible development of chronic lung abnormalities.

APPROACH: Infants admitted to the hospital with proven RSV lower respiratory tract disease in 1975 and 1976 who were prospectively evaluated have been recalled at ages 2-4 years for examination to determine their clinical and pulmonary status. An allergic predisposition is also being evaluated by history, IgE, and RAST testing. Infants admitted with lower respiratory tract disease in the winter of 1978-79 were also examined daily with oximetry, during hospitalization. These infants are now similarly being followed periodically to determine extent of recovery or development of new pulmonary abnormalities. During the coming 1980 RSV epidemic, infants with proven RSV from an ambulatory setting will be identified and enrolled in the study to compare the effects of less serious RSV on the development of subsequent pulmonary abnormalities.

ETIOLOGIC FACTORS INVOLVED IN THE INCREASED INCIDENCE OF ORAL CANCER IN GOA REGION

F. Dias, G.M. Hospital & Research Inst., Laboratories of Biochemistry & Immunology, *E. Borges Rd., Dona Paula, Ilhas, Goa 403004, India* (GCS/R/3)

Incidence of cancer of the oral cavity is observed to be higher than that of any other cancer type in this region. A study will be made to determine etiological factors for the increased incidence of oral cancer in the Goa region. Data on nutritional status, dietary history, occupation, and economic status will be collected. In addition, saliva and serum will be analyzed for nitrites, nitrosamines and antibodies to viral antigens to establish if there is any dietary or viral association with oral cancer in this region.

LUNG CANCER MORTALITY TRENDS IN PHILADELPHIA, PA, USA

W. Weiss, Hahnemann Medical College & Hospital, Medical College, Dept. of Medicine, *235 N. 15th St., Philadelphia, Pennsylvania* 19102

OBJECTIVE: To follow the trends in lung cancer mortality in Philadelphia from 1955.

APPROACH: The Philadelphia Department of Public Health publishes an annual statistical report which includes tables giving population and resident deaths by selected causes, age, race, and sex. These data are available, either in published form or in unpublished records, since 1954 as coded by the 7th revision of the ICD for most of the period before 1968 and by the 8th revision from 1968. The trends by age, race, and sex are being continually monitored and the race-sex data are being age-adjusted to the 1960 Philadelphia population.

PROGRESS: Contrary to the trends in the USA as a whole, the figures for Philadelphia have shown a marked diminution in the rate of increase in age-adjusted lung cancer mortality among both white and non-white males in the late 1960s and in the 1970s the rates have almost plateaued. In white females the slope has remained unchanged essentially since 1955. The number of cases in non-white females is too small to obtain reliable rates. Further observation and analysis continue.

DIET CHANGE AND NUTRITIONAL EPIDEMIOLOGY

I.J. Lichton, University of Hawaii System, Manoa Campus, Agricultural Experiment Station, Dept. of Food & Nutritional Sciences, *Gilmore Hall, Room 102, Honolulu, Hawaii* 96822 (0081828)

OBJECTIVE: Study the effects of diet on the risk of colon and breast cancer in Pacific women in relation to effects of diet on estrogen metabolism; effect of cessation of ovarian function; parallel effects of enzymes on the gut flora; relationship between shifts in hormone metabolism and enzyme activities to ability of microflora to convert specific hormones to carcinogens or promoter substances. Provide information concerning nutritional patterns as they relate to the etiology of non-infectious diseases among peoples of industrial societies and those living in developing tropical countries.

APPROACH: Literature will be surveyed for studies of the relationship between diet and risk of cancer and studies of people living in Hawaii related to dietary intakes, nutritional status, mortality and disease incidence, with particular attention to ethnic subgroups. A population group consuming diets low in protein but high in fat and an appropriate control group will be identified. Seventy-two hour female dietary records and fecal and urine samples will be obtained. Analyses will be done on estrogens, androgens, cholesterol and fecal mutagens.

FIBROUS CARCINOGENS IN TURKESTAN FLOUR

C.H. O'Neill, Imperial Cancer Research Fund, Anchorage Dependence Laboratory, *Lincolns Inn Fields, London WC2A 3PX, England, United Kingdom* (161)

Esophageal cancer is a major cause of death in parts of Turkestan. The local distribution of the disease in this region, and its occurrence in certain other remote and parts of the world, point to an environmental cause.

We have now been able to identify a sharply pointed silica fiber, about two hundred microns in length and three in diameter, as a common contaminant of the flour from this region. It is not present in European flour, or in flour from various villages in Turkey and Syria. It originates from the surface of the seed of a species of grass, Phalaris genus, which can readily be identified in the wheat because of its characteristic morphology. X-ray scattering distinguishes it from fibers of mineral origin such as asbestos and shows it to be pure silica. While we do not know how fibrous carcinogens act, we have in the past shown that they can stimulate the growth of cultured fibroblasts. Tissue culture experiments have now shown that Phalaris fibrils similarly cause conspicuous and immediate stimulation of the proliferation of 3T3 cells in soft gel suspensions, ultimately resulting in the production of large colonies.

During the course of the last year investigations in Iran have shown that 80 percent of the people in the affected areas suffer from esophageal dysplasia (leucoplakia). We have therefore instituted animal experiments to determine whether Phalaris fibers can cause similar dysplasia in mice, and whether they can promote the appearance of tumors initiated by chemicals. It is hoped that this work may eventually stimulate epidemiological testing of this hypothesis either in Iran or in the other affected regions (the Transkei and the area around Lin-Hsien in China).

EARLY BREAST CANCER - PATHOLOGY AND PROGNOSIS OF BREAST CANCER DEVELOPING IN PATIENTS TAKING ORAL CONTRACEPTIVES

J.L. Hayward, Imperial Cancer Research Fund, Breast Cancer Unit, *Lincolns Inn Fields, London WC2A 3PX, England, United Kingdom* (319)

An analysis has been carried out on all patients with breast cancer who have taken oral contraceptives at any time in the past. Clinical and histological features and prognosis have been compared with those in matched controls. A significantly higher number of the control patients had larger tumors and more extensive axillary node involvement than was found in the study group. Furthermore, a significantly greater number of patients in the study group had close relatives (mother or sister) who had had breast cancer than in the control group but the difference was not significant. These findings tended to reinforce those which had been reported in an earlier study on patients who had been taking the contraceptive pill during the year prior to diagnosis.

THE ANGLO-JAPANESE TRIAL - PATHOLOGY OF BREAST TUMORS IN GREAT BRITIAN AND JAPAN

J.L. Hayward, Imperial Cancer Research Fund, Breast Cancer Unit, *Lincolns Inn Fields, London WC2A 3PX, England, United Kingdom* (304)

It was noted (ICRF Scientific Report 1976 - Report 264) that Japanese patients with early breast cancer have a much higher incidence of sinus histiocytosis in uninvolved axillary lymph nodes than similar patients in Britain.

An attempt is now being made to compare urine and blood endocrine levels with sinus histiocytosis, in British and Japanese patients with breast cancer. Histological sections from the primary tumor and axillary lymph nodes are being obtained from those patients from whom urine and blood specimens were

collected for the original endocrine comparison between the two races. These sections have all been mounted and stained identically in the Breast Cancer Unit, and sent to St. Vincent Hospital, Massachusetts where they are being reviewed independently by three pathologists.

PATHOLOGY OF NORMAL AXILLARY LYMPH NODES FROM WOMEN IN GREAT BRITAIN AND JAPAN WHO DIED FROM CAUSES OTHER THAN BREAST CANCER (ABBREV)

J.L. Hayward, Imperial Cancer Research Fund, Breast Cancer Unit, *Lincolns Inn Fields, London WC2A 3PX, England, United Kingdom* (306)

Comparative studies of the pathology of breast tumors and axillary lymph nodes from patients in Great Britain and Japan have shown that Japanese patients with early breast cancer have a higher incidence of sinus histiocytosis in the uninvolved axillary lymph nodes than patients in Great Britain. The incidence of sinus histiocytosis in axillary lymph nodes from British and Japanese women without breast cancer is now being investigated. In Great Britain lymph nodes obtained from coroner's post mortems performed on women who die suddenly without evidence of any malignant disease are being collected so that the degree of sinus histiocytosis can be assessed in histological sections. Similar nodes are being collected in Japan.

COMPARATIVE STUDY OF CASES WITH CERVICAL DYSPLASIA AND A CONTROL GROUP - SOCIOFCONOMIC PROFILE, ESTROGEN STATUS (ABBREV)

U.B. Saraiya, Assn. of Medical Women in India, Cytology Clinic, *Mahapalika Marg, Bombay 400001, India*

OBJECTIVE: To study a group of women with dysplasia and another group of normal women from the same community. a) To outline the variables involved in epidemiology of cervix cancer. b) To assess the probable relationship of high estrogen status to precancerous and malignant lesions.

APPROACH: a) Multidimensional analysis of variables involved in epidemiology of cervical cancer. b) Assessment of estrogen status by vaginal cytology and endometrial aspiration in the patients with precancerous and malignant lesions of the cervix.

PROGRESS: About 500 cases are under surveillance and participate in a longitudinal study. a) A scoring system has been evolved to understand the profile of a woman who is at an increased hazard of cervical cancer. Three groups of cases have had their individual scores compared. The data is statistically significant. The majority of normal women have low scores while women with cancer show a higher score than those with dysplasia. b) Current methods used have not given satisfactory results. Serum or urinary estrogen assays will provide more reliable data.

INTRACANALICULAR PAPILLOMA OF THE BREAST - FREQUENCY IN OUR AREA AND ITS POSSIBLE RELATIONSHIP TO BREAST CARCINOMA

N. Gallo, Instituto Nacional de Cancerologia, Seccion de Cirugia, *Apartado Aereo #17.158, Bogota, DE, Colombia* (01-017)

OBJECTIVE: To clarify the possible relationship between intracanalicular papillomatosis and cancer of the mammary gland.

MATERIAL: Clinical histories of patients with confirmed diagnosis of intracanalicular papilloma alone or papillomatosis and breast carcinoma seen at our Institute between January 1958 and December 1975.

METHOD: Analytical retrospective study of these clinical histories. (Translated)

HEALTH EFFECTS DUE TO AN ACCIDENTAL EXPOSURE TO DIMETHOATE

E.L. Matos, Instituto Oncologia Angel H. Roffo, Departamento de Investigaciones, *Av. San Martin 5481, 1417 Buenos Aires, Argentina* (135)

OBJECTIVE: In May, 1979, an exothermic reaction occurred in the production of dimethoate (RN 60-51-5). The resulting escape of gases lasted 4 hours and ceased only upon consumption of all the existing product. Two persons died, and 30 exhibited symptoms of poisoning. Results of the testing of dimethoate for carcinogenicity in rats have been contradictory. On the other hand, this pesticide has been found to be mutagenic in S. cerevisiae and E. coli. The population that was most exposed (the firemen and security personnel who remained on duty during the entire fire) was studied and will be followed up as far as future incidence of tumors is concerned.

METHOD: Individuals were personally interviewed as to information referring to immediate, 2-, 8- or 12-month post-accident symptoms, closeness to cistern, seniority and position, poisoning antecedents, smoking and drinking habits. Blood samples were also taken in order to observe sister chromatid exchange (SCE) in peripheral lymphocyte chromosomes.

PROGRESS: One year after the accident the exposed group did not show any health problems. Chromosomal study revealed a significant SCE increase with respect to controls. Our first results have been submitted for peripheral publication.

SURVEY AND PROPHYLAXES OF ENDEMIC GOITER IN THE PROVINCE OF NORTH FRONTIER OF PAKISTAN

S.H. Khan, Pakistan Atomic Energy Commission, Inst. of Radiotherapy & Nuclear Medicine, Dept. of Nuclear Medicine, *c/o Peshawar University Campus, Peshawar, Pakistan*

The aim is to set up radioimmunoassay procedures for the measurement of T.S.H., T3 and T4 for areas where endemic goiter is prevalent. Problems related to collection, storage and transportation of blood samples will be investigated and will be tried to be solved by using special paper strips.

Survey of certain areas has already been done. This will be followed by collection of samples (blood, foodstuffs, water and soil) for chemical analysis. Bacteriological study of the drinking water (deep and superficial) will also be undertaken.

MEASUREMENT OF TRACE ELEMENTS IN HUMAN HEAD HAIR, TOBACCO ARTICLES AND FOOD GRAINS OF PAKISTAN

I.H. Qureshi, Pakistan Atomic Energy Commission, Nuclear Chemistry Div., *P.O. Nilore, Rawalpindi, Pakistan*

Increased use of chemicals in agriculture and industry is adversely affecting the quality of our environment. These chemicals enter the human body through atmosphere and food chain and affect human health. Therefore the measurement of toxic elements in food, water and atmosphere will provide useful information regarding their affect on human health.

Trace element analysis of human head hair and other body tissues is a favoured techniques for monitoring contamination of human body. Such studies may help in establishing co-relation between internal contamination and environmental factors and in assessing the safety of human diet.

In Pakistan, studies are being made on the measurement of toxic and other trace elements in human head hair using Instrumental Neutron Activation Analysis Technique. Samples of hair from male, female and children in different social and occupational groups are being analyzed to determine the prevailing concentration level of 14 trace elements. Studies are also being made on the measurement of 15 elements in cigarette tobacco and wrapping paper. Cigarette filter and the ash are being analyzed to determine the absorption of toxic elements and there transference in smoke. Food grain will also be analyzed to determine the concentration of various trace elements.

SUPPORTED BY International Atomic Energy Agency funds n.a.

3.0043,

COMPARATIVE STUDY OF CANCER RISKS FROM EXPOSURE TO EFFLUENTS FROM FOSSIL FUELLED AND NUCLEAR POWER STATIONS

K.G. Vohra, Bhabha Atomic Research Centre, Div. of Radiological Protection, *Trombay 400085, Bombay, India*

The future large scale production of nuclear power would involve radiation exposure of larger groups of occupational workers, individuals and groups in the population, and the population at large. In view of the concern about the risks of nuclear power often expressed by uninformed public, it is necessary that the risks associated with alternative energy sources such as those based on fossil fuels are compared with similar risks associated with nuclear energy production.

The risks of cancer mortality from ionizing radiations have been studied by two important international Committees, viz. the United Nations Scientific Committee on the Effects of Atomic Radiations and the US Advisory Committee on the Biological Effects of Ionizing Radiations (BEIR Committee). Extensive epidemiological data on the incidence of cancer is also available for several industrial cities, compiled by a number of research institutes. However there has been very little effort in collecting the data of both types at one institution and comparing the two in terms of quantitative risk evaluation.

The proposed program is concerned with the risks of cancer induction associated with the above two energy sources. The risks of specific cancers, for example, lung cancer, would be compared, based on extensive environmental measurements data and epidemiological data.

Risk analysis for radiation induced cancers will be based on the extensive data available on human exposure and animal experiments. The risk associated with fossil fuelled power stations will be assessed on the basis of available data on selected chemical carcinogens and the epidemiological data for urban areas affected by continuous operation of fossil fuelled power stations. The project will also include some measurements of chemical carcinogens in selected areas for direct comparison with epidemiological data.

LEUKEMIAS AMONG ATOMIC BOMB SURVIVORS - A SERIAL HEMATOLOGIC AND CYTOGENETIC STUDY

N. Kamada, Hiroshima University, Research Inst. of Nuclear Medicine & Biology, Dept. of Internal Med, *1-2-3 Kasumi Minami-Ku, Hiroshima 734, Hiroshima, Japan*

OBJECTIVE: Chromosome aberrations seem to be one of the most conspicuous residual abnormalities recognizable in radiation-exposed persons for many years after exposure. Knowledge of the biological significance of these abnormalities seems to be necessary for an understanding of the effects of radiation on humans, especially in relation to possible leukemia development. Our study focuses on leukemogenesis in atomic bomb survivors.

APPROACH: Cytologic and cytogenetic studies are performed on the bone marrow cells of atomic bomb-exposed patients who had prolonged periods of blood disorders which terminated in acute leukemia (Group I) and disorders which did not terminate in acute leukemia (Group II), and survivors who were in apparent good health (Group III).

PROGRESS: 1) Preleukemic states were observed in some leukemia patients. 2) Cytogenetically abnormal clones were observed in survivors who were exposed within 1,000 meters. 3) Two proximally exposed survivors found to have abnormal clones for

12 years developed chronic myelocytic leukemia and breast carcinoma respectively.

INFANT MORTALITY IN KANSAS: DIFFERENTIALS AND CAUSE-PERIOD PATTERNS

C.G. Flora, Kansas State University, School of Arts & Sciences, Dept. of Sociology Anthropology & Social Work, *Anderson Hall, Manhattan, Kansas* 66502 (0013761)

OBJECTIVE: The first objective is to measure the association between infant mortality and its components (neonatal and postneonatal mortality) and several income measures in order to ascertain the nature and extent of this traditional inverse relationship. This relationship will be examined longitudinally (1947-49, 1957-59, 1967-69, 1977-79) for the 105 counties of Kansas. The second objective is to analyze cause of death. Specifically, the second objective will examine the following: (a) calculate and describe the percentages of infant deaths in the neonatal and postneonatal periods for each of the four time periods; (b) investigate to determine if postneonatal cause of death are contributing to neonatal mortality and vise versa, which has been called the 'cause-period cross-over effect', (c) is a and b above occurring due to advances in medicine or socioeconomic changes (as measured by income). That is, are worsening socioeconomic conditions increasing the percentage of infant deaths in the postneonatal period or are medical advances prolonging the infants life into the second and subsequent months.

APPROACH: See objectives.

PROGRESS: The primary objective of this project was to measure the association between infant mortality and its components (neonatal and postneonatal) and socioeconomic and demographic characteristics in Kansas counties for the time period centering around 1975 in order to ascertain the nature of this traditional inverse relationship. Kansas' lower infant mortality rate compared to the U.S. rate was documented: 14.7 infant deaths per 1,000 live births in Kansas and 16.0 for the U.S. Highest infant mortality rates occurred in the state's agricultural areas, while the lowest rates were in non-metropolitan manufacturing counties. Service center and metropolitan counties were intermediate. Socioeconomic variables were found to be inversely related with infant mortality and its components. Education, income, the ratio of doctors to the population and the density of housing were sensitive and inverse indicators to the infant mortality rate. There were 21% more infant deaths in the 24 Kansas counties with the lowest educational levels than in the 32 Kansas counties with the highest educational levels. Two population change indicators were found to be related to infant mortality--net migration and total growth. Counties losing population had higher infant death rates than c (Text Truncated - Exceeds Capacity)

PILOT PROJECT FOR DETECTION OF UTERINE CANCER AND STUDY OF EPIDEMIOLOGICAL FACTORS

N.S. Amma, Medical College, Regional Cancer Centre, Division of Cytology, *Trivandrum 11, Kerala, India*

OBJECTIVES: 1) To detect pre-cancerous and early cancerous lesions of the uterine cervix by Pap Smear. 2) To investigate, treat and follow up these cases. 3) To ultimately reduce the incidence of carcinoma cervix in the screened population. 4) To study the epidemiological factors of the disease.

APPROACH: Information and Health education regarding the program were provided to the public by house-to-house visits and by other means like radio, press, cinema, etc. All married women above the age of 20 underwent a Pap Smear. The smears were collected by trained A.N.M.S. under the supervision of a doctor, screened by cytotechnicians and cytotechnologists and abnormal slides were interpreted by a cytopathologist. Cases of severe dysplasia, carcinoma in situ and invasive carcinoma were further investigated and confirmed by biopsy and appropriate treatment given and followed up. A protocol is filled for study of epidemiological factors.

PROGRESS: We have two such projects, one in a village and another in a city. The first project in the village was started in September 1978. We have screened about 20,000 women. The project is progressing well.

The second project in the city area was started in July 1980 and only 2500 women were screened to date. It is also progressing satisfactorily.

THE INCIDENCE OF STOMACH CANCER FOLLOWING FORMER ULCER OPERATION

C. Toftgaard, University Hospital of Aarhus, Dept. of Surgery, *Norrebrogade 44, DK8000 Aarhus C, Denmark* (28/79)

OBJECTIVE: The incidence of cancer of the stomach following former ulcer operation is discussed; it is believed to be up to six times higher than stomach cancer incidence overall.

APPROACH: A population of patients operated on for duodenal and stomach ulcers 20 to 25 years ago is established. The patients are identified through the Danish Cancer Registry and cancer incidence is calculated. The aim is to establish a population of at least 4000 operated on persons.

PROGRESS: The population is now being established and is going to be registered in EDB.

A CASE-CONTROL STUDY OF ETIOLOGICAL FACTORS IN URINARY BLADDER CANCER IN A RURAL PART OF DENMARK

S. Mommsen, University Hospital of Aarhus, Dept. of Oncology, *Norrebrogade 44, DK8000 Aarhus C, Denmark*

Epidemiological data are collected in 210 consecutive, newly diagnosed patients with bladder cancer. The patients are interviewed about exposure to chemical materials; alcohol, tobacco, medication and coffee consumption; use of artificial sweeteners; history of illnesses particularly of the urinary system and delay. Controls are selected randomly from the general population, matched to cases by sex, age and residence on a one-to-one basis for the males and on a one-to-two basis for the females. The possible interrelationship of the variables with other epidemiological variables is studied. These include socioeconomic factors, urban factors and occupational exposure. The data are coded for statistical analysis. In addition, the N-acetyltransferase phenotype is studied in patients and controls, smokers and nonsmokers in a rural population and the results are compared with results for an urban population.

RELATIVE FREQUENCIES OF PRIMARY CANCERS OF ALL SITES IN RAMATHIBODI HOSPITAL, 1974-1978

W. Isarangkul Na Ayuthya, Mahidol University, Ramathibodi Hospital, Dept. of Pathology, *Rama 6 Rd., Bangkok 4, Thailand* (C32/1979)

OBJECTIVES: 1. To study the relative frequencies of histologically diagnosed primary cancers of all sites in Ramathibodi Hospital from 1974 to 1978. 2. To test the computerized processing system for utilizing, on a large scale, data on surgical pathology.

APPROACH: Data for 1974-1978 were retrieved from the master file and those on primary malignancies were selected. The data were then automatically tabulated by anatomical sites, histological type, sex, age and ethnic group. The reports were checked and corrected for errors in disease classification (SNOP) codes, modified and the data were sometimes retabulated manually. Comparison of the frequencies with those of some Asian countries was also attempted.

PROGRESS: Sofar all the tabulations and statistical analyses have been completed. Interpretation and comparison are being done and final report is expected to be completed by August 1980.

EPIDEMIOLOGICAL STUDY COMPARING WOMEN WITH SYMPTOMATIC BREAST DISEASE AND A SCREENED NORMAL POPULATION

M.M. Roberts, University of Edinburgh, Dept. of Clinical Surgery, *Mayfield Rd., Edinburgh EH9 3JR, Scotland, United Kingdom* (G979/337)

OBJECTIVE: The objective of this study is to compare the clinical history and examination findings in women with symptoms related to the breast whom we have treated over the past ten years, with those in a normal asymptomatic population of women who underwent screening for breast disease. The aim of the comparison is to determine whether a group of women who are at high risk of breast cancer can be delineated, with obvious implications for future screening programs.

APPROACH: Computerized information, collected prospectively, is available on 9,500 women: 1,000 from Cardiff and 4,500 from Edinburgh Diagnostic Clinics; and 4,000 asymptomatic women from the Edinburgh Breast Screening Clinic. A total of 824 women were diagnosed as having breast cancer. The information includes data on menstrual status, parity and reproductive history, family history, previous breast disease, other diseases, drug history, clinical and mammographic examination. A multivariate and discriminant analysis will be performed to compare symptomatic women (with or without cancer) with a normal screened population; and secondly to define factors which will delineate a group of women at increased risk of breast cancer.

THE PSYCHOSOCIAL SETTING OF POLYCYTHEMIA VERA

H.J. Baltrusch, International Psychosomatic & Cross-Cultural Leukemia Proj., *Bergstrasse 10, D2900 Oldenburg, Federal Republic of Germany* (PSM-01/PV)

OBJECTIVE: Polycythemia vera (p.v.) is a rare myeloproliferative disease with unknown etiology and epidemiology. Accidental clinical observation suggest that the disease might be precipitated by psychosocial stress. An interdisciplinary controlled study has been begun in order to ascertain the possible role of psychosocial stress in the clinical manifestation and clinical course of the disease, and to determine how this is possibly correlated with hematologic and immunologic parameters.

APPROACH: Consecutive p.v. patients and their matched-pair controls (patients with polyglobulias) are studied by a structured interview schedule and a series of psychological tests, including Family Attitudes Questionnaire, Habits of Nervous Tension Scale, Defense Scale, Rorschach and TAT cards. Included in study is also the assessment of the patients' coping behavior, as well as aspects of guidance.

PROGRESS: So far, 23 patients have been studied. 21/23 pts. manifested their illness while unsuccessfully coping with major life stresses such as loss of a prominent family member, marital discord and occupational troubles. Moreover, poor adjustment with regard to marital, sexual and interpersonal relationships was found. Family Attitudes Questionnaires revealed a significant lack of emotional closeness to parents. The Habits of Nervous Tension Scale demonstrates an abnormal release of emotion prior to and during the course of the disease.

MANAGEMENT OF MAN-BITING INSECT PROBLEMS IN MICHIGAN

H.D. Newson, Michigan State University, School of Natural Sciences, Dept. of Entomology, *243 Natural Resources Bldg., East Lansing, Michigan* 48824 (0061171)

OBJECTIVE: Study biology, geographical distribution and seasonal incidence of haematophagous arthropods; determine incidence and distribution of arthropod-borne diseases, their significance to humans and animals and the vectors and reservoirs in sylvan transmissions; develop recommendations for biting arthropod control.

APPROACH: Survey and/or study selected areas to determine indigenous species of biting arthropods, their hosts and ecological relationships. Use information from State Health Department and State Wildlife Disease Pathologist to locate areas of arthropod-borne disease activity and study relationships of biting arthropods and their feral and human hosts. Develop a biting insect control program for use in the state park system, emphasizing management practices with minimal pesticide usage.

PROGRESS: Work was continued on the distribution and biology of Michigan mosquitoes. A manuscript, 'An annotated list of mosquitoes reported from Michigan, ' was completed and submitted for publication. This is the first compilation of this type for Michigan and will be a useful reference for future workers. The cooperative arbovirus surveillance program was continued with the Michigan State Department of Public Health. This consisted, in part, of studies on the biting habits, host preferences and seasonal distribution of Culex pipiens and C. restuans (the two most likely vectors of St. Louis encephalitis virus in Michigan) in areas of the state where virus transmissions were occurring (as determined by positive serology tests in bird blood samples). This is designed as an early warning system to detect impending outbreaks of arbovirus infections in humans. Virus transmission in Michigan during 1979 was low with only two reported human cases of St. Louis encephalitis (SLE) and six immature birds with antibody levels indicating prior SLE infections in 1979.

EPIDEMIOLOGICAL AND CLINICOPATHOLOGICAL STUDY OF T CELL MALIGNANT LYMPHOMA IN NAGASAKI DISTRICT

M. Ichimaru, Nagasaki University, School of Medicine, Dept. of Hematology, *12-4 Sakamoto-Machi, Nagasaki, Nagasaki, Japan*

OBJECTIVE: Clarify the distribution of T cell and B cell non-Hodgkin's lymphoma in Nagasaki and study the specific clinicopathological features of T cell leukemic malignant lymphoma in this district.

APPROACH: Study the surface markers of tumor cells of non-Hodgkin's lymphoma by using tumor cells in peripheral blood or cells of biopsied lymph nodes of all cases of non-Hodgkin's lymphoma experienced. Pathological findings of lymph nodes, morphological features of tumor cells, clinical features and effects of chemotherapy and epidemiological differences are also studied.

PROGRESS: Tumor cells of 106 patients with non-Hodgkin's lymphoma in the Nagasaki district (Japan) were examined for the presence of T-cell or B-cell markers. Seventy-nine (74.5 percent) of the 106 non-Hodgkin's lymphomas were of T-cell origin, and 49 (62.0 percent) of these T-cell lymphomas were leukemic. The incidence of T-cell lymphoma was higher than in other districts (except Kagoshima) in Japan and in Western countries. PDLL, mixed type and large lymphoid by Rappaport's classification were common in these T cell lymphomas, according to histological findings of lymph nodes. Clinicohematological features of these T cell lymphomas have been studied. These lymphomas were characterized by nucleic pleomorphism of leukemic cells, high percentage of skin rash, hypercalcemia and specific infections, etc.

EPIDEMIOLOGICAL STUDY ON THE HOST-ENVIRONMENT INTERACTION IN HUMAN CARCINOGENESIS

S. Fukuma, Chiba Cancer Center Research Inst., Division of Epidemiology, *666-2, Nitona-Cho, Chiba 280, Chiba, Japan*

OBJECTIVE: It is generally accepted that human cancers are mainly caused by the carcinogenic effect of environmental materials, e.g., tobacco and food additives. Some occupations may also be included among such environmental factors, but they have not yet been adequately studied in many countries. Furthermore, it is also hypothesized that hereditary factors for cancer liability interact with environmental ones and intensify their hazardous effect, but at present there are few demonstrable examples of the host-environment interaction in epidemiological studies. The object of our study is, first, to identify any occupations with suspected high risk of cancer and, second, to examine whether any synergistic effects of familial cancer history and occupational factors can be found.

APPROACH: Data are available in the hospital records of Chiba Cancer Center Hospital and the population-based Cancer Registration Center of Chiba prefecture.

PROGRESS: Data accumulation and analysis are ongoing.

EVALUATION OF POTENTIAL CANCER HAZARDS OF OCCUPATIONAL EXPOSURES BY SHORT-TERM MUTAGENIC ASSAYS

G. Scassellati Sforzolini, Universita degli Studi di Perugia, Facolta di Farmacia, Cattedra di Igiene, *Via del Giochetto, 06100 Perugia, Italy*

Whereas several laboratories have begun using mutagenic screening techniques to test mutagenic activity of single agent, our interest has been primarily concentrated on a study of the mutagenicity of multiple environmental agents, actually encountered in occupational exposure.

For our research program we have chosen to study the work environment of one industry of an industrialized zone of Central Italy which utilizes potentially carcinogenic products such as carbon and petroleum pitches.

Mutagenicity short-term tests by microbial systems are performed either in samples of these products or in air samples collected from working environment (in toto and fractionated), in order to study the feasibility of utilizing these rapid tests to evaluate the mutagenic (and potential carcinogenic) risk of industrial processes. The examined samples are analyzed also for the presence of polycyclic aromatic hydrocarbons.

Besides, epidemiological surveys on exposed workers are carried out and their urine is analyzed to test mutagenic activity using the same microbial short-term tests.

INVESTIGATION OF SELECTED VEHICLE ACCIDENTS

D.F. Huelke, University of Michigan, Ann Arbor Campus, Inst. of Science & Technology, Highway Safety Research Institute, *Box 618, Ann Arbor, Michigan* 48104 (2R51232147)

Objective: To establish the mechanisms of trauma in motor vehicle collisions through intensive study of the relationship of occupant injuries to vehicle components, crash severity, and restraint system effectiveness. Significance: The emphasis of this continuing program is on establishing precisely how and why the injuries occurred and how they can be prevented or reduced. Methods: Approximately 130 collisions per year are selected from Washtenaw County crashes for detailed investigation. Only crashes with the following characteristics are selected: The crash has resulted in an injury; the vehicle (a late-model passenger car, pickup truck, van, recreational vehicle, or large truck) was manufactured by an MVMA-member company; the vehicle was towed away from the accident scene; and the vehicles involved can be examined within 48 hours of the collision. Results: Each clinical case is documented with the Collision Performance and Injury Report long form; detailed medical report; 35 mm color slides of the accident scene, vehicles, impacted object, exterior and interior damage; and reporting on other pertinent factors (alcohol, drugs, extrication complications, etc.).

STUDY OF A POPULATION EXPOSED TO HIGH LEVELS OF CHROMIUM IN WATER

S. Ghignone, Instituto Oncologia Angel H. Roffo, *Av. San Martin 5481, 1417 Buenos Aires, Argentina*

Several studies have shown an increased incidence of cancer in workers involved in the manufacturing of chromates, and in vitro studies have shown an increase in chromosomal observations and sister chromatid interchange in cells treated with hexavalent chromium. The maximum acceptable level of hexavalent chromium in drinking water is 50 micrograms/kg, according to the WHO. In the San Martin municipality of the province of Buenos Aires a high level of chromium contamination has been found in water used by inhabitants adjacent to a plating factory. Levels of hexavalent chromium detected in wells used as water sources were on the order of 5 mg/kg. At that time various pathologic conditions of the skin and respiratory, digestive and urinary systems of the local inhabitants were evident.

OBJECTIVE: The 208 affected individuals will be followed up to determine whether they develop a higher incidence of cancer than that of the general public.

METHOD: The exposed population has been questioned regarding personal data; residence and water supply over the last 10 years; occupation; social habits; and in particular, regarding their ingestion of liquids during the period of contamination. Clinical symptoms observed have also been recorded. This information is being processed. A yearly follow-up for at least 10 years is planned. (Translated).

MULTIDISCIPLINARY STUDY OF A FAMILIAL AGGREGATE OF HODGKIN'S DISEASE, OTHER LYMPHATIC MALIGNANCY AND IMMUNODEFICIENCY CASES

W.H. Marshall, Memorial University of Newfoundland, School of Medicine, Immunology Research Laboratory, *Health Science Complex, St. Johns, Newfoundland, Canada* A1C 5S7

A familial aggregate of cases of Hodgkin's disease, other lymphatic malignancies, embryonal tumors and immunodeficiency has occurred in a genetically isolated Newfoundland population.

OBJECTIVE: To attempt to a) define a genotype that is susceptible to development of Hodgkin's disease and other disorders; b) see if a particular immunological phenotype may confer susceptibility; c) discover if infection with E.B. virus or other members of the herpes group is associated with the aggregate; d) integrate all the above data to construct an epidemiologic picture of what may have happened in this community.

APPROACH: To study the whole community so that observations are internally controlled. A data bank of pedigree data, genetic markers, immunological profiles and anti-viral antibody titres has been compiled. Analyses are proceeding.

PROGRESS: The aggregate has been described (Clin. Invest. Med. 1980, two papers); associations with Rhesus negative state (Vox Sang, 1979), with elevated IgD and IgM (Int. Arch. Allergy and Appli. Immunol. 1980), with HLA-B18 (Int. J. Cancer 1977) are all published. The latest pedigree analytic work is in press (Thompson, E., Heredity, 1980 or 81). A

recessive susceptibility gene predisposing to both HD and ID now seems likely.

THE USE OF IN VIVO CYTOGENETIC TESTS FOR ASSESSING POPULATION CANCER RISKS

D.J. Tomkins, McMaster University, Dept. of Pediatrics, *1200 Main St. W., Hamilton, Ontario, Canada* L8S 4L8

OBJECTIVES: There are many physical and chemical agents in the human environment which are capable of causing genetic damage. The present hypotheses are: one, that genetic damage can lead to the development of cancer many years after exposure, and two, that chromosome damage is an indicator of such genetic damage. The major objective of this proposal is to assess the usefulness of in vivo cytogenetic tests for monitoring populations exposed to mutagenic or carcinogenic agents. A second objective is to compare cytogenetic tests with another genetic assay: urine mutagenicity using microbial test for mutation, both with and without mammalian metabolic activation. Long-term objectives are: one, to establish a reliable protocol for monitoring the exposure of human populations to environmental health hazards, and two, to relate genetic damage in an individual to subsequent health risks.

APPROACH: Three cytogenetic endpoints, chromosome aberration, sister chromatid exchange (SCE) and formation of micronuclei will be evaluated for their reproducibility, sensitivity and usefulness as indicators of exposure to mutagens and increased cancer risk. Recent studies have identified a defined population of steel foundry workers who are exposed to high levels of mutagenic air particulate and who have a high mortality rate due to lung cancer. It is proposed to compare the frequencies of chromosome abnormalities, SCE and micronuclei in three groups: the high-risk population of foundry workers, a low-risk group of workers in the same foundry who are not exposed to the high levels of mutagenic particulate and a group of office workers at the same plant. Care will be taken to match exposed subjects with their two controls for sex, age, medications, medical status, and smoking habits. Simultaneous studies of these individuals are being carried out by Dr. D.R. McCalla, Department of Biochemistry, McMaster University, using a urine bioassay for mutagenicity in microbial mutation tests with and without metabolic activation.

EPIDEMIOLOGY OF LUNG CANCER IN WOMEN

A.B. Miller, National Cancer Inst. of Canada, Epidemiology Unit, *12 Queens Pk. Cres. W., c/o University of Toronto, Toronto, Ontario, Canada* M5S 1A8

OBJECTIVES: 1. To determine the extent to which lung cancer in women is attributable to cigarette smoking. 2. To assess in women, in comparison with an age-matched series of men, the risk of smoking different types of cigarettes. 3) To assess in women and in an age-matched series of men with lung cancer, the possible protective effect of vitamin A-containing foods. 4. To attempt to assess in women the contribution of other suspect risk factors in the etiology of lung cancer including occupation, passive smoking and exposure to other known environmental factors.

APPROACH: Over a two-year period, all newly diagnosed cases of lung cancer in women will be identified in Metropolitan Toronto. Three comparison series will be also identified: an age-matched series of men with lung cancer from the same institution as the index case, and two population control series derived from municipal enumeration lists matched by age and sex with the two series of cases of lung cancer. Each case and each control will be interviewed in their homes and a questionnaire obtaining information on smoking, occupation, consumption of vitamin A-containing foods, exposure to smoke from others at home and at work, family history and other suspect risk factors will be obtained. It is anticipated that 380 index cases will be interviewed during a two-year period of study, the third year to be devoted to analysis preparation and report.

ROLE AND SIGNIFICANCE OF HUMAN PAPILLOMA VIRUS INFECTION IN THE GENESIS OF CERVICAL NEOPLASIA

A. Meisels, Hospital du St. Sacrement, Laboratory Medicine, *1050 Chemin, St. Foy, Quebec, Canada* G1S 4L8

OBJECTIVE: We intend to determine whether human papilloma virus (HPV) infection of the cervix (flat condylomata), a sexually transmitted disease, is morphologically similar to mild and moderate dysplasia, but regresses without any direct relationship to the latter; or whether flat condylomata are really identical to mild and moderate dysplasia, which would indicate that HPV may play a role in the development of cervical neoplasia.

APPROACH: There are precise criteria for differential diagnosis of condylomata of the cervix, based on clinical, cytologic, colposcopic and histopathologic studies. With these criteria it was found that condylomata of the cervix are much more frequent than was formerly suspected. We now intend to specify the differential diagnostic criteria of condylomata using immuno-peroxidase (Pap test), immunofluorescence and immune electron microscopy, using an anti-HPV. Ultrastructural histomorphology of condylomata and mild and moderate dysplasia will be reviewed. We hope to find ultrastructural criteria of differential diagnosis and possibly some evidence on which to base predictions as to which of the intraepithelial lesions are more likely to progress towards invasive neoplasia.

Finally, regression, persistance or progression of condylomata will be studied on an epidemiological basis using our computer files which contain data on more than 250,000 patients of which more than 3,600 exhibit some evidence of intraepithelial lesions of the cervix. When we reviewed these intraepithelial lesions using the new differential diagnostic criteria, it was found that over 70% could be considered condylomata on light microscopic examination. Our epidemiological studies should reveal the evolution of these condylomatous lesions.

It is hoped that this work will help to clarify the significance of human papilloma virus infection as related to cervical neoplasia.

THE PREVENTION AND MANAGEMENT OF INFECTION IN GRANULOCYTOPENIC PATIENTS

A.R. Ronald, University of Manitoba, School of Medicine, Dept. of Medical Microbiology, *770 Bannatyne Ave., Winnipeg, Manitoba, Canada* R3E 0W3

OBJECTIVES: 1. To study 'colonization resistance' in patients on selective suppression of aerobic gastrointestinal flora. 2. To determine if co-trimazole can prevent colonizaton and infection with C. albicans and compare it to nystatin. 3. To develop serologic techniques to identify Candida and Asperigillus infections by antigenic recognition. 4. To further study an animal model of neutropenia and spontaneous bacteremia in order to determine the efficacy of antimicrobial regimens in the prevention of bacteremia and the maintenance of 'colonization resistance'. 5. To study cytotoxin producing clostridia as intestinal pathogens in neutropenic patients.

APPROACH: Patients during their nuetropenic episode will be randomized to two different prophylactic regimens: trimethoprim/sulfamethoxazole or nalidixic acid/polymixin. Prospective surveillance will be carried out throughout their neutropenic episode with microbiologic and serologic studies to determine the etiology of febrile episodes and the epidemiology of pathogens which colonize these patients. These patients will also be randomized to cotrimazole or nystatin.

PROGRESS: During the past year we have demonstrated the epidemiology of multiply resistant coagulase negative staphylococci in patients on chemoprophylaxis with trimethoprim/sulfamethoxazole. We have also further developed the animal model so that neutropenia, spontaneous bacteremia, and subsequent septic death can be quantitatively predicted. The introduction of various organisms and antimicrobial regimens into this model is currently underway.

These studies will facilitate a more rational approach to neutropenic patients to insure their survival through the episode of neutropenia with the ultimate goal of increased remissions and potential cure of neoplastic disease.

PULMONARY MINERAL FIBERS AND LUNG CANCER

A.M. Churg, University of British Columbia, Dept. of Pathology, *6174 University Blvd., #300, Vancouver, British Columbia, Canada* V6T 1W5

This project attempts to determine if the particulate component of air pollution, specficially the fibrous mineral component, can be correlated with the presence of lung cancer. The project utilizes a case/control method. Mineral fibers are extracted from lungs of lung cancer patients and matched (age, sex, smoking, occupational group) controls. Fibers are counted, measured, and identified using electron optical techniques. Statistical correlations are attempted for a variety of fiber parameters (number, mineral type, size, aspect ratio) and combinations of parameters and the test and control groups compared.

STUDIES ON THE CARIOGENIC MICROORGANISM, STREPTOCOCCUS MUTANS

A.H. Rogers, University of Adelaide, School of Dentistry, Dept. of Oral Biology, *Adelaide, S. Australia 5000, Australia*

The main objectives of the project are (1) to monitor the inter-personal transfer of S. mutans to determine whether dental caries is a transmissible disease in humans, (2) to isolate, purify and characterize some S. mutans bacteriocins and (3) to investigate microbial interactions in dental plaque with particular reference to the role of bacteria production in such phenomena.

Examination of a number of family groups suggests that intrafamilial transfer of S. mutans does occur and these studies are continuing.

Joint studies with Dr. J.S. Van der Hoven of the University of Nijmegen the Netherlands, using both germ-free and specific pathogen-free rats suggests that bacteriocin-producing strains of S. mutans establish with greater facility than do non-producing strains; and also that the stability of the indigenous plaque flora is also an important factor in determining whether or not S. mutans colonies plaque.

A MULTIPLE SCLEROSIS CASE-CONTROL STUDY IN OLMSTED AND MOWER COUNTIES, MINNESOTA

L.T. Kurland, Mayo Clinic, Dept. of Medical Statistics & Epidemiology, *200 1st St. S.W., Rochester, Minnesota* 55901

In an effort to identify etiologic risk factors operating in the development of MS, a population-based case-control study is proposed to investigate a series of potential etiologic variables, including small pet exposure, utilizing the unique capabilities of the Mayo Clinic record system in Rochester, Minnesota. All cases diagnosed as MS while living in Olmsted and Mower Counties, Minnesota, over the past 40 years will be ascertained. Those currently residing in these counties will serve as index cases. One general Clinic and one neighborhood control, matched by age, sex, urban-rural residence and county, will be identified for each case, as well as sibling controls where available. We anticipate approximately 120 cases and 340 controls.

Cases and controls will be personally interviewed regarding not only pet exposure but also demographic factors (marital status, education, etc.), personal habits (smoking, alcohol use, etc.), previous medical

history (childhood illnesses, etc.), events prior to onset, other environmental exposures (sanitation, unusual chemicals, etc.), diet, and family history (of polio, other neurologic diseases, etc.).
The conduct of an epidemiologic study utilizing the resources of the Mayo Clinic system should serve to clarify further the issue of the relationship of small pet exposure and development of MS, as well as other etiologic leads.

MUTAGENIC ACTIVITY OF UNINVOLVED MUCOSA OF CANCER PATIENTS

D.W. Piper, Royal North Shore Hospital of Sydney, Dept. of Medicine, *Pacific Hwy., St. Leonards, Sydney, N.S.W. 2065, Australia*
The fact is well established that cancer of the colon is associated with excess bile salt excretion. However, bile salts alone are not mutagenic and consequently the aim of the present project was to investigate whether the uninvolved mucosa of cancer patients can convert a non-mutagenic bile salt into a mutagen. The bile salt chosen in this study was 3-methyl cholanthrene and the mutagenic activity was assessed using Ames' technique. It has been demonstrated that the uninvolved mucosa of cancer patients, like the cancer tissue itself, can convert 3-methyl cholanthrene into a mutagenic compound. This activity is possessed equally by the uninvolved mucosa of cancer patients and by the cancer tissue and there is far less activity in the mucosa of the colon of non-cancer patients. In addition in some patients, the S9 fraction of the uninvolved mucosa alone is mutagenic.
These observations fit many of the previous metabolic and epidemiological observations relating to colon cancer.

3.0073,
EVALUATION OF ALTERNATE STRATEGIES FOR CONTROL OF XEROPHTHALMIA (VITAMIN A DEFICIENCY) IN THE PHILIPPINES

M.C. Latham, Cornell University, Ithaca Campus, Agricultural Experiment Station, *Ithaca, New York* 14850 (0072127)
OBJECTIVE: Determine the extent of the problem of vitamin A deficiency in Cebu in the Philippines and evaluate the feasibility effectiveness and cost of alternate strategies for its control.
APPROACH: Twelve areas in four different ecological zones (two urban and two rural) are being studied. Clinical, biochemical and dietary information indicated the extent of the vitamin A problem. Three intervention strategies are being evaluated each in 4 locations. These include providing a high dose vitamin A capsule every six months to children, fortification of MSG with vitamin A, and a public health and horticulture intervention.
PROGRESS: Xerophthalmia has been found to be an important cause of blindness in the Philippines. An earlier study had investigated its prevalence and epidemiology on the island of Cebu. The research consisted of an evaluation of the relative effectiveness of three different intervention strategies to control vitamin A deficiency in Cebu. These interventions were 1) a public health and horticulture intervention, 2) the provision of 200,000 IU of vitamin A to children every 6 months (the 'capsule intervention'), and 3) the fortification of monosodium glutamate with vitamin A. A total of 12 areas or barangays were included. Each intervention was monitored in four different barangays. Similar examinations were performed before and after the interventions. The monosodium glutamate fortification was the only intervention that resulted both in a significant reduction in clinical signs of xerophthalmia and in a significant rise in serum vitamin A levels. Fortification is now being evaluated in two whole provinces (Nueva Viscaya and Marinduque). Cebu is serving as a control province. This project, if successful, may lead to a national fortification to prevent blindness due to vitamin A deficiency.

THE EPIDEMIOLOGY OF VISCERAL LARVA MIGRANS

R.H. Cypess, Cornell University, Ithaca Campus, New York State College of Veterinary Medicine, *825 Veterinary Research Tower, Ithaca, New York* 14853 (0074936)
OBJECTIVE: Determine the validity and reliability of the ELISA in the diagnosis of acute VLM.
APPROACH: Measure prevalence of antibody in several populations of children by using cross-sectional analysis. These studies should enable us to assess the Public Health implications of environmental contamination with this nematode.
PROGRESS: It has been suggested that epileptic children have a higher rate of positive skin tests with Toxocara canis antigen in comparison to apparently healthy persons. Using an enzyme-linked immunosorbent assay, we tested 84 epileptic children from an outpatient seizure clinic and 108 non-epileptic children from the same hospital for the presence of antibody to T. canis. The geometric mean of the reciprocal titer for the epileptics was significantly higher. However, if migrating nematode larvae can precipitate electrical discharge in the brain, we would expect to find higher Toxocara antibody titers in children with idiopathic epilepsy compared to epileptics of known or suspected etiology. We found no significant difference in titer among these groups. Instead, pica, mental retardation and hyperactivity were frequent findings in the epileptics and it appears that it is these conditions which predispose them to Toxocara infection. There was no evidence to support the hypothesis that larval migration was the cause of epilepsy.

3.0075,
CHROMOSOME ANALYSES OF PERSONS OCCUPATIONALLY EXPOSED TO SUSPECTED MUTAGENS/CARCINOGENS

A. Brogger, Norsk Hydros Inst. for Cancer Research, *Montebello, Oslo 3, Norway*
OBJECTIVE: Chromosome damage (gaps, breaks, exchange) and increased sister chromatid exchange in cultured lymphocytes from peripheral blood indicate that the subject has been exposed to a mutagen, which also may have a carcinogenic effect. Chromosome analyses may be used to monitor workers suspected to have been exposed to environmental mutagens in the work place. Quantitative risk estimates of genetic damage to future generations and of neoplastic disease based on the chromosome data cannot be given. Measureable chromosome damage, however, is generally considered unwanted. The results may therefore be used in the determination of permissible exposure.
APPROACH: Samples of peripheral blood are taken from exposed workers and suitable controls from the same factory. 48-hour lymphocyte cultures are prepared for analysis of chromosome damage, and 72-hour cultures with BrdU are prepared for sister chromatid exchange counting. Preparations are coded and analyzed blindly.
RESULTS: So far two studies have been performed: 1) Workers in nickel refinery were found to have an increased incidence of chromosome gaps. 2) Gaps were also increased in one group of nurses handling cytostatic agents and in another group engaged in radiology. In the first group increased sister chromatid exchange was also found. With the strict use of protective measures (mask, gloves, fume cabinet) sister chromatid exchange frequencies were normalized.

ESTROGEN TREATMENT AND CANCER OF THE ENDOMETRIUM - A PROSPECTIVE EPIDEMIOLOGICAL STUDY

E.D. Johansson, University Hospital, Dept. of Obstetrics & Gynecology, *S75014 Uppsala 14, Sweden*
The objective of this follow-up study is to further investigate in a prospective manner the demonstrated association between estrogen treatment and endometrial cancer in climacteric women. To obtain a study cohort of estrogen treated women a special organization has been working to collect prescription forms from all pharmacies in a geographical region. Data on identity and drug usage will be extracted from these forms. All new cases occurring in the same region are being collected by means of reports from pathology departments. To demonstrate at least a twofold increase in the incidence it will be necessary to follow approximately 20,000 women. The cohort will be followed for at least five years, but the observation time can easily be prolonged. The incidence in the cohort will be compared to that in the remainder of the population and estimates of relative risks will be calculated. All new cases, exposed and non-exposed, are being continuously examined for certain relevant characteristics such as obesity, hypertension, diabetes, infertility, etc. Comparisons of the distributions of these characteristics will allow for analyses of confounding data. A mailed inquiry will be sent to a large random sample of the cohort to ascertain drug compliance and distribution of patient characteristics among estrogen users.

RISK OF MALIGNANCY IN GASTRIC REMNANT - ENDOSCOPIC STUDY WITH HISTOLOGY, CYTOLOGY, ANALYSIS OF REMNANT CONTENT (ABBREV)

F. Nilsson, University Hospital, *S75014 Uppsala 14, Sweden* (1993)

OBJECTIVE: To measure the frequency of premalignant and malignant changes in the operated stomach and to study macroscopically, histologically and cytologically the type of mucosal changes by time. To analyze the content in the gastric remnant with special regard to alkaline reflux, bile, pancreatic juice, bacteria and fungi. To clinically evaluate symptomatology and chemistry and to develop a method for demonstration of bile reflux with external detection. To be able to obtain information which can be of value in the future treatment of this large group of patients.

APPROACH: Patients treated surgically more than 20 years ago with gastric resection because of benign ulcer disease are investigated. Gastroscopy is performed, multiple biopsies, brush cytology and aspiration of gastric contents. The presence of bile acids an anaerobic and aerobic bacteria is analyzed. A quantitative determination of bile reflux is made by scintigraphic technique and gamma camera registration and these results will be correlated with the endoscopic findings.

EPIDEMIOLOGIC STUDIES ON MALE LUNG CANCER IN NORTHERN SWEDEN

L.G. Larsson, University Hospital of Umea, Centre of Oncology, *S90185 Umea, Sweden*

A demographic study of the age-adjusted incidence rates of different cancer types in the three northernmost counties in Sweden 1959-1971 revealed pronounced differences between the municipalities as regards male lung cancer. Most municipalities in the western part of the region had very low incidence rates compared to the more urban and industrialized municipalities along the Baltic coast and two northern municipalities with mining districts. An almost identical pattern was found when the period 1972-1977 was studied. In order to elucidate possible risk factors, an extensive case-control study is performed comprising about 600 cases from 1972-77 with analysis of smoking habits, employment and specific occupational exposures.

The study will be completed during 1980.

RELATION BETWEEN ENVIRONMENT AND CANCER

R. Rylander, Goteborgs Universitet, Dept. of Environmental Hygiene, *411 Vasaparken, S40010 Goteborg, Sweden* (754-880-03X)

OBJECTIVE: The objective of the research project is to study the relation between different factors in the general and working environment and the presence of cancer in exposed populations. Attempts will be made to relate individual factors as well as environmental exposures to the development of a particular tumor form.

APPROACH: The Swedish National Mortality Registry and the Swedish Cancer Registry are used in the study. With the aid of recorded deaths or registered cases of cancer, the geographical distribution in the country is studied. At sites where accumulations are found, case-related studies are performed to evaluate environmental factors. Studies are also made in specific counties where an increase in the incidence of a particular tumor form has been suspected or in communities where the presence of local industries has been related to the presence of specific tumors, either in the working population or in the general environment.

PROGRESS: An observed increase in the incidence of liver cancer was found to be related to an increase in autopsy frequency. A higher incidence was found in large cities in Sweden, which could be related to alcohol habits, also demonstrating themselves as an increase in the cases of liver cirrhosis.

In a Swedish county a population density gradient was found for lung cancer. As air pollution levels are low, the difference was attributed to differences in smoking habits between rural and urban areas. The cancer increase in one community was related to the handling of asbestos in an industry.

Continued work on the project involves an analysis of the geographical distribution of pancreas and kidney cancer, followed by a study on cancer in children in the age groups up to 10 years.

IMPORTANCE OF MENOPAUSAL ESTROGEN TREATMENT FOR THE RISK OF BREAST CANCER

L. Thoren, University Hospital, Dept. of Surgery, *S75014 Uppsala 14, Sweden*

OBJECTIVE: To test the hypothesis that estrogen treatment of postmenopausal women increases the risk of subsequent breast cancer or stimulates the growth of manifest but subclinical cancer.

APPROACH: Breast cancer incidence will be prospectively studied in a cohort of about 25,000 patients consisting of all women over 45 years of age within a defined geographic area who have estrogens prescribed during a 3 year period. A detailed assessment of estrogen exposure will be made in a sample from the cohort and the distribution of risk factors will also be assessed in an age-matched sample from the general population. A comparison between the observed and the expected breast cancer incidence will be made after 5 years of observation or more.

3.0083,

STUDY OF OVULATORY MENSTRUAL CYCLES AS A RISK FACTOR IN BREAST CANCER

E.E. Hardy, Universidade Estadual de Campinas, Faculdade de Ciencias Medicas, Depto. de Tocoginecologia, *Rua Benjamin Constant 1657, Caixa Postal 1170, Campinas 13100, Brazil*

OBJECTIVE: To study the use of anovulatory contraceptive methods and the total number of ovulatory cycles that a woman experiences during her life, or up to the time of breast diagnosis, as risk factors for breast cancer.

METHOD: Subjects were selected from among women who consulted at the State University of Campinas Hospital, and at the Gynecology and Breast Pathology Institute of Campinas. Cases and controls were matched by age at diagnosis (5 year age groups), site of selection, and date of diagnosis. Subjects were interviewed, using a structured partially pre-coded questionnaire. Information was obtained on: menstrual, pregnancy and nursing histories, use of anovulatory contraceptives and family history of breast cancer.

PROGRESS: Data collection and coding have been completed. Consistency of the information was checked with computer programs. Interviews were held with 174 cancer cases and 325 controls. A method was developed to evaluate each subject's total menstrual history, by reducing the length of reproductive life (age at menopause or at breast diagnosis minus the age at menarche) of each woman by the time she was pregnant, in post-partum amenorrhea, taking anovulatory contraceptives or simply not menstruating.

Preliminary results show that the selection of controls was correct in terms of age distribution and education of subjects.

MEAN MARROW DOSE AND 'LEUKEMIA DOSE' OF THE SWISS POPULATION (1978)

G.G. Poretti, Universitat Bern, Radiuminstitut, Dept. of Medical Radiation Physics, *c/o Inselspital, CH3010 Bern, Switzerland* (6.197-0.76)

OBJECTIVE: Calculation of the mean marrow dose and of the 'leukemia dose' of the Swiss population (1978-79).

APPROACH: The 'annual mean marrow dose of a population' can be calculated from the single doses received from each part of active bone marrow irradiated in the course of an X-ray examination and, as in the case of the genetically significant dose, from the demographic data. The annual mean marrow dose (1971) for the Swiss population was tentatively calculated using the values of the mean marrow dose per examination of the UK survey of 1957/58 and amounts to about 121 mrad. Barium meal contributes about 30% of the total; intravenous pyelography, barium enema, lumbar spine and mass miniature radiographies each account for about 10%.

PROGRESS: Experimental measures and calculation of the mean marrow dose of the Swiss population. Low dose radiation burden of a population in connection with the increase of the (myelotic) leukemia cases.

CHECKLIST AND TRAINING GUIDELINES FOR AGRICULTURAL WORKER SAFETY

D.L. Roberts, Clemson University, Agricultural Experiment Station, Dept. of Agricultural Engineering, *Long Hall, Clemson, South Carolina* 29631 (0072857)

OBJECTIVE: Develop a usable safety and health inspection checklist having a hazards hierarchy for S.C. Agricultural Branch Experiment Stations and a modified version for the agricultural producer. Establish guidelines for agricultural employee training in high-potential accident job functions.

APPROACH: Define ag worker annual job functions at ag exp stations; index jobs' potential for serious acci; develop hazards hierarchy checklist on basis of indexing to include items based on characteristics of 72-76 worker injury reports, NSC survey statistics of farm acci, OSHA requirements, etc.; compile & establish guidelines for ag employ e training for safe & healthful job performance; test checklist & use training guidelines at ag exp stations & modify for ag producer.

PROGRESS: Six years of injury reports (785) were analyzed for South Carolina Agricultural Experiment Station workers. Partial findings support the statement that nearly all such injuries can be prevented through improved worker training and worker's subscription to correct work procedures and use of personal protective equipment. Preliminary descriptions of agricultural job functions according to their potential for producing serious accidents or health hazards. (Job's Hazards Hierarchy) coupled with characteristics of the 785 accidental injuries and other agricultural accident data indicate areas where improved and increased training would be beneficial. Most agricultural jobs have been rated to have very low potential for serious injury or health hazard. Jobs rated to have slight to high potential for serious injury/health hazard show most potential for beneficial worker training in 'risk assessment of jobs'.

RISK OF CHILDHOOD CANCER FOLLOWING INTRAUTERINE EXPOSURE TO ANTIEPILEPTIC DRUGS

V.K. Hiilesmaa, Helsingin Yliopisto, Dept. of Gynecology/Obstetrics, *Fabianinkatu 33, SF00290 Helsinki, Finland*

OBJECTIVE: The aim of the study is to investigate whether a mother's use of antiepileptic drugs during pregnancy is associated with an increased risk of childhood malignancies in her offspring.

APPROACH: A cohort of about 3000 children born to epileptic mothers in the years 1970-79 is identified through the files of the National Health Insurance and Pension Institution (Kansanelakelaitos) of Finland. Cases of childhood cancer among these children are identified by the standard reporting of new cancer cases to the Finnish Cancer Registry (Syoparekisteri). Incidence of malignancies among the children of epileptic mothers who have been on antiepileptic drugs during pregnancy is compared with the overall incidence of childhood cancer in Finland or with the incidence among a control cohort of children of non-epileptic mothers matched for age, area of residence, social class or other relevant factors.

ETIOLOGY AND PATHOGENESIS OF MULTIPLE SCLEROSIS

F.S. Lief, University of Pennsylvania, School of Veterinary Medicine, Dept. of Animal Biology, *39th & Pine, Philadelphia, Pennsylvania* 19104 (0075235)

OBJECTIVE: As a subcentractor to the Multiple Sclerosis Research Center at Wistar Institute and the University of Pennsylvania, my part in the objectives are: To try to isolate virus from MS tissues by inoculation into certain cell culture systems, eggs and into non-human primates; test the efficacy of non-human primates as a model for production of MS inoculating them with suspect viruses; conduct sero-epidemiologic studies in human populations with suspected viruses.

APPROACH: The procedures are self-evident. In these procedures, constant surveillance using a variety of techniques are stressed. The seroepidemiologic studies are being performed by a variety of techniques - CF, neutralization and radioimmune assay methods. They are designed to compare distribution of antibodies in high and low risk MS areas and to compare their prevalence in sera and spinal fluids in MS patients as opposed to matched controls.

EPIDEMIOLOGICAL EVALUATION OF HUMAN AND ANIMAL HEALTH AS ASSOCIATED WITH CONTAMINATED WELL WATER

A. Robinson, University of Minnesota, St. Paul Campus, School of Veterinary Medicine, Dept. of Large Animal Clinical Sciences, *256 Veterinary Science, St. Paul, Minnesota* 55101 (0077655)

OBJECTIVE: Determine the severity, frequency and magnitude of motality and morbidity in humans and animals consuming well water of various qualities. Estimate the economic impact of mortality and morbidity in humans and animals as a result of consumption of contaminated well water supplies. If needed, provide a description of the cost benefit ratio of implementing available methods to treat contaminated water or provide alternative sources of water, in cases where it has been indicated as the source of human and domestic animal illness.

APPROACH: Analyze the health of humans and domestic animals who obtain their water supply from wells of various construction and depths in the Karst topography of southeastern Minnesota. Approximately 20 farms will be included in the study. Farms presently participating in the School of Public Health Study to identify significant indicators of contamination will be utilized, including cohorts of humans and animals consuming a satisfactory quality of water, and those consuming an unsatisfactory quality of water.

PROGRESS: Fifty DHIA dairies from Fillmore County, MN were divided on the basis of well water samples and geological strata into (a) those with contaminated water and (b) those with uncontaminated water. Although group (a) farms had higher milk and fat production, less mastitis and lower WMT scores, the differences were not statistically significant. Twenty-two swine farms were similarly examined for production differences (litter size and litter percentage weaned) in relation to well water quality. No significant differences were detected. The parents of approximately half (117) of the two-year-old children in Fillmore County were questioned regarding the health of their children. Twenty-two percent of the parents reported that the children had suffered from a severe diarrheal illness. Children drinking water contaminated with either fecal coliforms or nitrates had 2 1/2 times the risk of developing illness than nonexposed children.

NUTRITION, FOOD HABITS, AND OTHER FACTORS IN HEALTH AND PRODUCTIVITY OF SMALL FARM RESIDENTS

M.E. Kassouny, State University System of Florida, Florida State University, School of Home Economics, Dept. of Food & Nutrition, *205 Wildwood Dr., Tallahassee, Florida* 32306 (0033117)

OBJECTIVE: Determine nutritional intake, food acceptance, food acquisition methods and other related practices. Assess nutritional status and identify nutritional, psycho-social, and other health-related factors unique to the rural environment influencing growth, development and productive longevity. Study the feasibilty of increasing the psycho-social contacts between young and old. Determine the needs and feasibility of making available low cost high-nutrient foods, nutrition information, and other health-related services.

APPROACH: Low income farm families and individuals living in Suwanee, Lafayette, Madison, and Hamilton Counties will be studied. Nutritional, demographic, psycho-social, and other health-related information and data will be obtained through Census and Vital Statistics records and through interviews to determine baseline values. Data will be compared to established norms. Based on results, corrective measures will be initiated to provide the target groups with needed and acceptable high-nutrient foods at least cost and other health-related services. The strengths and weaknesses of the corrective measures will be evaluated against pre-determined criteria of well-being and productivity.

LEVELS OF POLYCHLORINATED BIPHENYLS IN HUMAN MILK

E.P. Savage, Colorado State University, College of Veterinary Medicine & Biomedical Sciences, Dept. of Microbiology, *Fort Collins, Colorado* 80523 (0076002)

OBJECTIVE: Expedite the Epidemiologic Studies Program within the designated study area to provide further data on the effects of exposure to pesticides on the health of the population.

APPROACH: The Epidemiologic Pesticide Studies Center of the Institute of Rural Environmental Health at Colorado State University will determine on a national basis the magnitude of human exposure to pesticides by monitoring residues and metabolites of pesticide in the general and/or in specific populations. They will conduct epidemiologic studies of various exposed population groups and seek information on the potential effects of these exposures on the induction of disease. The Center will devise better means for recognition, diagnosis, and treatment of pesticide poisoning in man.

PILOT EPIDEMIOLOGY STUDIES IN THROMBOSIS

J.M. Iacono, U.S. Dept. of Agriculture, Agricultural Research, Nutrition Inst., Lipid Nutrition Lab., *Bldg. 308, Room 126A, Beltsville, Maryland* 20705 (0046169)

OBJECTIVE: Conduct a pilot dietary intervention study to determine the degree that dietary fats influences tendency for blood clotting, thrombosis, and hypertension in specific population groups.

APPROACH: These pilot dietary intervention studies will be carried out in Italy, Finland and Argentina. Platelet and plasma lipids and prostaglandins will be tested prior to, during and after dietary fat modification of subjects. Functional tests of blood platelets, blood clotting and blood pressure will be made.

PROGRESS:

NUTRITIONAL EPIDEMIOLOGICAL STUDIES

S. Gershoff, Tufts University, Medford Campus, School of Arts & Sciences, Nutrition Institute, *Medford, Massachusetts* 02155 (0045742)

OBJECTIVE: Provide information concerning nutritional patterns as they relate to the etiology of non-infectious diseases which are public health problems among people of both industrialized societies and those living in developing tropical countries.

APPROACH: A systematic survey and review of all published data on people living in Hawaii related to dietary intakes, nutritional status, mortality and where available from registries, disease incidence will be undertaken. Particular attention to sub-populations will be given. Data obtained from different ethnic groups in Hawaii will be compared with data from their native countries. Sampling frames for a baseling survey of appropriate subpopulations with reference to nutritional and health status will be established.

ETIOLOGY AND EPIDEMIOLOGY OF MUSHROOMS COMPOST COMPETITORS

R.A. Calderone, Georgetown University, School of Medicine, Dept. of Microbiology, *3800 Reservoir Rd. N.W., Washington, District of Columbia* 20007 (0044593)

OBJECTIVE: Develop new and essential information about the causes and occurrence of mushroom compost competitors, and identify and evaluate specific fungi and actinomycetes as incitants of hypersensitivity pneumonitis (mushroom worker's lung) and make recommendations for control to mushroom growers.

APPROACH: Conduct a complete mycological investigation of the microbial flora of the mushroom growing media and atmosphere at various stages of crop preparation growth and clean-up to determine which specific organisms are responsible: Identify and culture fungi which cause pneumonitis reactions in mushroom workers. Extract and characterize antigens from these fungi which promote these reactions. Evaluate purified allergens as incitant of pneumonitis reactions using animal models. Elucidate commercial practices which control the condition.

PROGRESS: Actinomycetes and fungi chiefly responsible for the respiratory disease, mushroom worker's lung, were isolated from mushrooms composted at the end of the growing operation (spent compost) using Anderson samplers. Although the results showed large differences in microbial content, approximately 43 species of fungi were isolated. The most abundant form s included: Aspergillus fumigatus, A. flavus, A. clavatus, A. nidulans, A. glaucus, Absidia spp. Oedocaphalum spp. and Penicillium oxalicum. Thermoactinomycetes vulgaris, Streptomyces, spp., and Micropolyspora faeni were the chief actinomycetes isolated. Steaming of the spent compost prior to sampling resulted in 60-70% reduction in the viable microbial population. Sensitizing studies on rabbits with various extracts of the spores of these organisms are in progress. They shall give more detailed information about which organism(s) is responsible for the allergic disease.

3.0095,

PARAMETERS OF CARBOHYDRATE SENSITIVITY

O.E. Michaelis, U.S. Dept. of Agriculture, Agricultural Research, Nutrition Inst., Carbohydrate Nutrition Lab., *Bldg. 307, Room 315, Beltsville, Maryland* 20705 (0042002)

OBJECTIVE: Determine and validate parameters of carbohydrate sensitivity in BHE rats and humans and assess the influence of factors such as age, sex, diet composition and meal spacing on these parameters.

APPROACH: The study will be divided into three phases each contingent upon the phase preceeding it. Completion of the characterization of the carbohydrate sensitive BHE rat. This will include: Determination of the age changes in cortisol as it relates to the age changes in insulin status and the utilization of dietary carbohydrate. Determination of factors which will affect carbohydrate sensitivity such as sex, meal spacing and age of exposure to a high carbohydrate diet. Application of animal findings to humans in an epidemiological study of carbohydrate intake, hyperglycemia and hyperlipemia risk factors and the predictive effectiveness of a) above.

PROGRESS: Male weanling lean Zucker rats were meal-fed or ad libitum-fed diets containing 54% carbohydrate as sucrose, invert sugar, or cooked cornstarch for 4 weeks. At the end of the feeding period, fasting levels of serum glucose, triglyceride, glycerol, free fatty acids, total and high density lipoprotein (HDL) cholesterol were determined. A feeding pattern effect was observed with food intake, body weight gain, serum triglyceride, glycerol, total and HDL cholesterol. With the exception of HDL cholesterol and free fatty acids, blood lipid levels were higher for meal-fed than for ad libitum-fed rats. In ad libitum-fed rats, the sucrose effect (sucrose greater than starch) was observed in serum glucose, total cholesterol and free fatty acid levels; whereas, the disaccharide effect (sucrose greater than invert sugar) was observed in free fatty acid and triglyceride levels. Both a sucrose and disaccharide effect were seen in triglyceride and free fatty acid levels of meal-fed rats. HDL cholesterol and glycerol levels were not significantly affected by diet. The present study demonstrates that under specific conditions feeding sucrose can increase serum glucose, trigly-

ceride and free fatty acid levels to a greater extent than the monosaccharide equivalent (invert sugar).

3.0097,

ARTHROPODS OF MEDICAL AND VETERINARY IMPORTANCE

R.L. Smith, University of Arizona, Agricultural Experiment Station, Dept. of Entomology, *Tucson, Arizona* 85721 (0028287)

OBJECTIVE: Monitor the impact of noxious arthropods on the health of human and domestic animal populations in Arizona. Maintain high degree of readiness to research arthropod problems that pose an inordinately high risk to human and domestic animal populations in Arizona. Intensively research the biology of the black widow spider in urban environments.

APPROACH: Maintain close contact with Federal, State, and local public health officials to identify incipient problems. Regularly contact county agents for reports on outbreaks of noxious arthropod-related problems. Validate reports by on-site surveys. Maintain reference materials on arthropod-health related problems in Arizona. Maintain standard research equipment, supplies and trained technical personnel ready to handle urgent research needs. Coordinate emergency research activities with governmental agencies. Conduct field surveys and laboratory experiments to study defensive biting, urban habitat requirements and food habits, predators and parasites, mating behavior, and control strategies for the black widow spider.

PROGRESS: Black widow spiders, Latrodectus hesperus, were subjected to direct tactile stimulation in order to determine the circumstance under which they might bite non-prey. Spiders consistently responded to probing by retreat. A large percentage of those probed also emitted viscid silk globules that may have a defensive function against potential vertebrate predators. Although spiders rarely bit, hungry females and those guarding egg sacs were more inclined to bite than well-fed females without egg sacs. Females rarely bit in response to gradually administered intense pressure, but about 60% bit when subjected to repeated rapid applications of pressure. We have attempted to relate these data to the circumstances under which humans might be bitten and conclude that the actual threat of human envenomization in modern urban environments has probably been exaggerated. Eggs of Latrodectus hesperus were incubated at six temperatures. Mean developmental times were plotted against temperatures, resulting in a J-shaped curve. The reciprocal of the mean developmental period plotted against temperature produced a sigmoid rate curve. Development accelerates with increased temperature to the inflection point (26 degrees C), then decelerates. The optimum temperature was 35.5 degrees C, suggesting that L. hesp (Text Truncated - Exceeds Capacity)

LIFE SATISFACTION, HEALTH RECORDS AND SOCIAL PARTICIPATION AMONG SEVERAL POPULATIONS

M. Pilisuk, University of California, Davis Campus, Agricultural Experiment Station, Dept. of Applied Behavioral Science, *Davis, California* 95616 (0078044)

OBJECTIVE: Testy the broad general relationship thought to exist between the degree and quality of an individual's participation in family and community activities and the individual's vulnerability to pathology and maladaptive behavior.

APPROACH: Survey methods will be used to gather data on population which by virtue of social marginality may be vulnerable to pathology and maladaptive behavior: Senior citizens living alone; recently divorced or legally separated adults; adults following the birth of a first child; families with tow full-time working parents and children under 13 years of age; unemployed persons seeking employment for more than 9 months; physically disabled persons; dryg adddicts and alcoholics in non-metropolitan areas; patients restricted in activity following hospitalization; age and socioeconomic status-matched samples for baseline comparison.

PROGRESS: The methodological difficulty posed by the problem of finding groups who by virtue of stressful circumstances will be prone to breakdown and who, at the same time, wil have complete medical records and be available for assignment to 'low' or 'high' social support variations has been solved. The samples will be family members of individuals who have suffered hospitalizaion, and are enrollees in a prepaid health care program. The identified patient, the stressor source for the remainder of the family, will be one whose particular disability is likely to provide stressful circumstances to other family members. Methods for assessment of social support levels have been reviewed. These include: The Social Network Scale (Froland, 1977); The Social Disruption Index (Pearlin and Lieberman, 1976; The Social Support Network Questionnaire (Pilisuk and colleagues, 1978); The Denver Social Adjustment Scale. Measurement and data collection measures will be adapted from these existing assessment tools for this study. A pilot study to be administered during this project year is being developed to assess the adequacy of the instruments. Contact regarding a site for the study has been made with the director of a major Kaiser health program in Northern California. An aritcle, 'Kinship Social Networks, Social Support and Health, ' providing the theoretical background for this study has been published.

ECOLOGY AND GENETIC STABILITY OF FOOD POISONING C. BOTULINUM AND C. PERFRINGENS

H.P. Riemann, University of California, Davis Campus, School of Veterinary Medicine, Dept. of Epidemiology & Preventive Medicine, *Davis, California* 95616 (0002606)

OBJECTIVE: Find the natural reservoirs of food-poisoning strains of C. perfringens and C. botulinum and obtain information as to how these reservoirs are maintained. Obtain information with respect to the genetic control of toxigenicity in these two organisms.

APPROACH: Survey of prevalence and possible causal factors of C. botulinum will be carried out in areas epidemic with respect to wild fowl botulism, ranches, and slaughter houses and data studied epidemiologically. Same for C. perfringens. Genetic transfer will be studied by application of adapted genetic techniques and use of toxigenic and non-toxic mutants with appropriate genetic markers. Special attempts will be made to look for incomplete toxins, i.e., serologically cross-reacting materials.

PROGRESS: A number of seagull sera from Alaska were tested for botulinum antitoxins with negative results. Otherwise, research activities have been very limited because of lack of funds. A grant proposal for ecology studies of C. botulinum has been submitted to USPH.

THE EPIDEMIOLOGICAL ASSOCIATION OF ELEVATED BLOOD PRESSURE WITH NITRATE EXPOSURE

E. Savage, Colorado State University, College of Veterinary Medicine & Biomedical Sciences, Dept. of Microbiology, *Fort Collins, Colorado* 80523 (0071139)

OBJECTIVE: Determine the relationship between high nitrate levels and hypertension in the young. Determine whether hospitalization due to hypertension occurs at an earlier age in communities serviced with potable water high in nitrates. Suggest methods to reduce hypertension morbidity and mortality.

APPROACH: A hospital records search will be made in hospitals selected at random. Primary and secondary cases of benign essential hypertension and demographic data will be evaluated. The second stage of this research will involve a state-wide study of Colorado school children to determine the status of hypertension in the young and its interrelationship to nitrate exposure through various environmental substrates.

PROGRESS: Two areas of interest concerned with the association between health and potable water nitrate levels were investigated epidemiologically. The major research effort involved a retrospective study of hospitalized hypertensives in eastern Colorada. Twenty-three randomly selected hospitals agreed to participate. Data collection was completed in June 1977. Epidemiologic information from approximately 8700 hypertensive patients was abstracted to an approved questionnaire. Coding and quality control of the questionnaires were completed in preparation for keypuncking. Keypunching is in progress. the investigation of the hypertension-nitrate interaction prompted additional research involving nitrate exposure and cancer mortality. Master's thesis project entitled 'Colorado Cancer Mortality and Potable Water Nitrate' was completed. This effort was a descriptive study of potable water nitrate and cancer of the bladder, esophagus, and stomach. Colorado death certificates between 1970 and 1975 from the four cancers were classified (by cause of death) according to the listed county of residence and placed within one of eight subgroups dependent on nitrate amount and degree of urbanness. Average, annual, age-adjusted mortality rates for each cancer were calculated for white males and females within each subgroup. A significant rate difference ($p=.05$) among subgroups was noted for stomach cancer.

3.0101,

HUMAN FACTORS ENGINEERING

R.H. Wilkinson, Michigan State University, Agricultural Experiment Station, Dept. of Agricultural Engineering, *New Administration Bldg., East Lansing, Michigan* 48823 (0067899)

OBJECTIVE: Study the agricultural worker's performance, safety and comfort as affected by: machine vibrations, noise, dust, temperature, humidity and other environmental factors, machine controls, display location and operator position.

APPROACH: Field studies to determine health problems of agricultural workers. Develop vibration measuring capability for field studies of conditions, experienced by machine operators. Monitor body functions (i.e. heart rate, muscle tremor, etc.) as a measure of man's physical response to job demands, vibration, environment and work space. Modify a tractor cab to control and analyze environmental stress. Simulate work tasks to evaluate mental and physical performance. Evaluate shape coding of controls, location, movement, displays and operator position on performance. Evaluate performance in various milking parlor configurations.

PROGRESS: The 'Occupational Health Survey of Michigan Farmers' (1974) revealed a number of interesting observations. Among these were: (1) chronic back pain is the major health problem encountered by these farmers; (2) dust is the most important environmental problem they encounter; (3) noise induced hearing loss increases with years of farming exposure and is higher for farmers than normally would be expected due to aging. These observations prompted further research and considerable time and effort was directed to a study of farmer back pain. A complex mathematical model of the human back was developed by Oscar Braunbeck (Ph.D. Project) which revealed that the lower back is most susceptible to vibration in the range of 50 hz. - a frequency that corresponds to engine vibration. This is a new insight as most previous work has been directed to low frequency vibration originating from rough terrain and ride. The concern for farmer hear-

ing loss has resulted in free hearing tests for farmers at the annual MSU Farmers Week program and an MSU Extension Bulletin regarding noise and hearing loss. An M.S. graduate student project 'The Effects of Whole Body Vibration Upon Reaction Time and Performance' was done by R. McHawe. He found that particular frequencies did degrade operator performance.

ELEMENTS OF NUTRITIONAL ANEMIA AMONG BLACKS IN CENTRAL MISSOURI, PHASE II

R.M. O'Neal, Lincoln University, School of Agriculture, Dept. of Agricultural & Natural Resources, *Jefferson City, Missouri* 65101 (0074830)

OBJECTIVE: Delineate the types and extent of the anemias associated with nutrient deficiencies, i.e., iron, folic acid and vitamin B(12). Relate the incidence and types of nutritional anemies to the food consumption patterns of the population groups. Relate socioeconomic characteristics of the population groups to the incidence of nutritional anemias and food consumption patterns.

APPROACH: Samples of participants from black population in Central Missouri will be determined. Blood samples, food recall history and socioeconomic records will be obtained. Blood will be checked for anemia and nutrients. The blood data and food intake will be examined for correlation.

PROGRESS: Elements of Nutritional Anemia Among Blacks in Central Missouri-Phase II. During the year 1979, the collection of data was completed on ninety-five (95) black families. Complete biochemical analyses were made on two hundred forty-nine (249) subjects. These analyses included 175 assays of serum ferritin. All of the dietary, socioeconomic, medical and biochemical parameters have been keypunched and these data have been put through statistical exercises. It was noted from this, that there was a large percentage of the population which reported low folic acid intake; this was supported by a large percentage of the population having relatively low values for serum folic acid. Also it was noted that there was very positive correlation between low hemoglobin and low serum ferritin values of the ones analysed to date. Some other very interesting preliminary associations have been seen and are being programmed through the computer at this time. The remainder of the serum ferritins is being analyzed at this time and this will complete the biochemical analyses.

SUPPORTED BY U.S. Dept. of Agriculture, Cooperative Research Office, Missouri funds n.a.

3.0103,

DETERMINANTS OF CONSUMER HEALTH STATUS IN THE NON-METROPOLITAN AREAS OF CENTRAL NEW YORK

P.S. Chi, Cornell University, Ithaca Campus, Agricultural Experiment Station, Dept. of Consumer Economics & Public Policy, *Ithaca, New York* 14850 (0074273)

OBJECTIVE: Collect micro-data on consumer health status and related information; assess health levels of certain groups within the non-metropolitan areas of Central New York; construct a multivariate model in which the key determinents of consumer health status will be ascertained; develop policy recommendation and publish research results.

APPROACH: A sample of 800 respondents will be randomly selected from the six non-metropolitan counties in Central New York. A mail-questionnaire will be the instrument for data collection. Techniques of cross-tabulation and standardization will be used to compare health levels among different social groups in the sample. Pathanalysis is the method for multivariate model construction.

PROGRESS: Due to severe reduction in the proposed research budget, the amount of actual funding is not adequate to conduct a social survey as originally planned. Instead, a substituted data set, the Pre-Retirement Health Survey, was obtained from the U.S. Department of Health, Education and Welfare. This data set not only contains numerous questions relevant to consumer health status but also possesses several distinctive features: (1) it is a national representative sample, including respondents from both metropolitan and non-metropolitan areas in the United States; (2) it is a longitudinal survey, covering the interviews of the same individuals for three time periods--1969, 1971 and 1973; (3) it is a survey of pre-retired and retired individuals who usually involve a great deal of health problems. Based on the unique nature of the Pre-Retirement Health Survey, it is felt that the proposed research model on consumer health status can be adequately tested with this data set. The previously completed literature review is still valid and useful for future analysis. The future research will focus on (1) comparisons of consumer health status between metropolitan and non-metropolitan areas; (2) analysis of determinants of health status of older consumers; (3) study of changes in health status of older consumers over time. It is expected that the Pre-Retirement Health Survey will not only provide us with data to test the proposed model, but also broaden the scope of the original research.

EXPOSURE LEVELS OF RURAL NORTH CAROLINIANS TO CADMIUM AND TRACE METALLIC ELEMENTS

A.N. Williamson, University of North Carolina, North Carolina Agricultural & Technical State University, School of Arts & Sciences, Dept. of Chemistry, *N. Dudley St., Greensboro, North Carolina* 27411 (0080891)

OBJECTIVE: To determine the exposure levels of rural North Carolinians to Cd and related trace elements. To identify those areas in the state with high Cd levels and determine the average daily dietary intake of Cd by the inhabitants of those areas. To identify those foods indigenous to high Cd areas and determine Cd content and the extent of their use. To determine if daily intake of Cd from drinking water and foodstuffs pose any long range threats. To determine if patterns exist between Cd levels and the rates of occurence of renal and cardiovascular disease.

APPROACH: Cadmium exposure levels will be determined from the amounts of Cd ingested in foodstuffs and drinking water. Those areas in the state with high Cd levels will be targeted through reviews of existing data pertaining to chemical analyses of surface and ground water and soil assays. The average daily intake of Cd will be determined from the amounts of food consumed and the Cd content of such food and water. Chemical analyses of foodstuffs and water will be performed using Atomic Absorption Spectrophotometry and Colorimetry. Average daily exposure levels will be compared to the average American daily intake to see if any significant differences exist.

BURN INJURY STUDY: PRODUCT-RELATED BURN VICTIMS

C.M. Janeck, North Dakota State University, School of Home Economics, Dept. of Textiles & Clothing, *Fargo, North Dakota* 58102 (0079797)

OBJECTIVE: Determine the relationship of clothing-related and interior product-related burn injuries in everyday living and working situations to selected characteristics of individuals during a specified period of time for a well defined population.

APPROACH: A questionnaire for reporting individual burn injuries will be sent to each hospital in North Dakota. The questionnaire employed is a modification of the one used for the Nebraska Burn Study (1975). A questionnaire will be completed from the medical records of each inpatient by the hospital staff. The North Dakota Hospital Association has approved the study and recommends participation by the individual hospitals. The questionnaire was designed to eliminate duplication in retrieved data, to eliminate outpatients, to classify types of burn injuries, and identify factors which contributed to the accident. The total number of burn injuries and the number and characteristics of clothing-related and interior product-related injuries and deaths for fiscal year July 1, 1979 through June 30, 1980 will be determined for North Dakota. A statistical analysis will be completed. Result from the North Dakota study will be compared to other states in the North Central region and with data collected on a national level.

PROGRESS:

SUPPORTED BY U.S. Dept. of Agriculture, Cooperative Research Office, North Dakota funds n.a.

3.0106,

ZINC AND CADMIUM STATUS OF CHILDREN AND ADOLESCENTS IN SOUTH CAROLINA

R.F. Borgman, Clemson University, Agricultural Experiment Station, Dept. of Food Science, *Long Hall, Clemson, South Carolina* 29631 (0070134)

OBJECTIVE: Determine the concentrations of zinc and cadmium in the hair of South Carolina adolescents attending 4H camps and correlate the results with tests to determine the ability to taste. Determine the concentrations of zinc and cadmium in the deciduous teeth of children from an area of South Carolina where ischemic heart disease and hypertension incidence is high and compare the results with deciduous teeth from areas of South Carolina where the incidence of these diseases is lower.

APPROACH: Volunteers at 4H camps will be administered a test for ability to taste, and will be questioned as to the type of water they generally consume, ie. municipal, shallow well, or deep well. Hair samples will be obtained and analyzed for zinc and cadmium. Performance in the ability to taste, type of water consumed, area of residence, and other personal information will be correlated. Deciduous teeth from children will be collected from areas of the state with a high incidence of cardiovascular disease and from areas with a low incidence of cardiovascular disease. Analyses of these teeth will be made for zinc and cadmium content, and the result will be correlated with the areas and the type of water generally consumed by the individuals.

PROGRESS: Approximately 1,800 4H campers from all areas of South Carolina were examined at 2 state 4H camps. Age of campers ranged from 9 through 14 years, included blacks and white, and both sexes. Hair samples are being analyzed for Zn, Cd, Cu, Se, Cr, and Pb. Results are not complete at this time. However, the range of Pb concentrations in human hair has been noted to range from nil to 20ppm. Blood pressure determinations indicate that obesity and overweight conditions contributes to adolescent hypertension (above 129mm Hg systolic and above 90 mm Hg diastolic). The incidence of adolescent hypertension was greater in the coastal counties (8 to 10%) than in the Piedmont counties (1-2%). The incidence of adolescent hypertension parallels the incidence of ischemic heart disease, stroke, and hypertension in the adult population.

3.0107,

BURN INJURY STUDY: PRODUCT-RELATED BURN VICTIMS

M.M. Hurlocker, South Dakota State University, School of Home Economics, *Brookings, South Dakota* 57006 (0079429)

OBJECTIVE: Determine the relationship of clothing-related and interior product-related burn injuries to various segments of the population in everyday living and working situations during a specified period of time for a well-define population.

APPROACH: The questionnaire, refined from the Nebraska Burn Stidy, will be sent to every hospital in South Dakota and will be completed from the medical records of inpatients by the hospital staff. The State Health Department of South Dakota has endorsed the proposal for this project. Additional information will be obtained from data files of the Office of the State Fire Marshall. The questionnaire was designed to eliminate duplications in retrieved data and to eliminate outpatients, classify burn injuries, and identify factors which contribute to the accident. The total number of burn injuries and the number and characteristics of the clothing-related and interior product-related deaths and injuries for fiscal year (July 1, 1979 through June 30, 1980) will be determined for South Dakota. Further statistical analysis will be developed as needed to utilize the information obtained from the questionnaire.

PROGRESS: The fires and burn-related newspaper articles from South Dakota are received weekly from a news media clipping service and are recorded by county for use in completing questionnaires. Packets containing a cover letter, instructions and questionnaires were sent to all seventy hospitals in South Dakota on October 12. As of December 31, thirty hospitals have responded. One hospital has closed, one does not treat burn injuries, one is sending the medical records without the patient's identity for completion of the questionnaires. Several hospitals have misinterpreted the closing date and one chose not to cooperate. Thirty-four completed questionnaires have been received and are being coded for

computer storage. Approximately 25% of this project has been completed.

3.0109,
AN EPIDEMIOLOGICAL STUDY OF MENTAL HEALTH NEEDS OF RURAL COUNTIES IN TENNESSEE

B.A. Husaini, State University & Community College System of Tennessee, Tennessee State University, School of Arts & Sciences, Dept. of Sociology, *Nashville, Tennessee* 37203 (0070866)
OBJECTIVE: Determine the mental health needs and their specific etiological factors in the rural communities of Tennessee; determine the variation in both the needs and their etiology in relation to the demographic characteristics; determine the extent to which mental health services are utilized in the rural communities; determine the relationship between the demographic characteristics and both the use of mental health services and the degree of satisfaction with the services received; and develop model plants and services directed toward an effective resolution of mental health needs of the rural communities.
APPROACH: The study will use the survey method where individuals between the ages of 18 and 65 years will be interviewed for approximately an hour.
PROGRESS: Data analysis indicate that approximately 11% of the rural population is psychiatrically high risk and may require some form of services. Also, psychiatrically impaired individuals tended to be older and from lower SES. They tended to have had a greater number of medical problems and to have had a greater number of life change events. They had limited internal adaptive capacities and few external supportive ties. Further, they had a greater number of marital problems and tended to be dissatisfied not only with both the parenting and housewife roles but also, on the whole, with their family life. Only 4% had sought professional help for themselves. Even though between 5% and 10% of respondents indicated a willingness to seek professional help, it is clear that rural residents rely more upon informal, nonprofessional help than upon formal, psychiatric help sources. These findings help to provide a clearer understanding of factors and processes involved in the development of psychiatric disturbances and have implications for planning and treatment modalities.

TEXAS TRI-COUNTY NUTRITION SURVEY

A.C. Washington, Texas A & M University, Prairie View A & M University, Agricultural Experiment Station, *Prairie View, Texas* 77445 (0065933)
OBJECTIVE: Determine the dietary status of the subjects included in this study with specific reference for adequacy of vitamin A, vitamin C, riboflavin, iron, calcium and serum protein. Determine food intake, preparation of food, food habits, mores and attitudes toward foods by subject groups. Develop a program which may be implemented and which will provide adequate nutritional status through proper food intake, preparation, food habits, changed mores and attitudes toward foods by subject group.
APPROACH: Methodologies and guidelines from the Manual of Nutrition Surveys and the Ten-State Nutrition Survey will be used. Clinical assessments will be made of each subject including medical history and examination, a dental examination, anthropometric measurements such as height, weight, and subcutaneous fat. Urine and blood samples will be assayed for vitamins A, C, B(2), iron calcium, and serum protein levels.
PROGRESS: Approximately six hundred and twenty-five households, comprising more than fifteen hundred people over a period of five years have been interviewed concerning their dietary habits. The twenty-four hour dietary recall method was used to obtain the data. These data reveal the following: (1) Thirty-three percent of black Americans consumed below normal amounts of protein followed by 27% for whites and 24% for Mexican Americans, (2) Serum analysis for each group reveals that 26% of the Black population had below normal serum protein levels followed by whites at 25% and Mexican Americans at 13%, (3) The data for serum calcium and iron tended to corroborate data report in the Ten State Nutrition Surveys and the HANES Report. Blacks had a higher incidence of calcium and iron deficiency than whites and Mexican Americans. Similar trends also existed for riboflavin deficiency. Serum vitamin A and vitamin C analyses revealed that Mexican Americans and Blacks had generally higher values than Whites--for serium vitamin C. Serum Vitamin A levels for Blacks, Whites, and Mexican Americans regardless of age and sex were generally found to be deficient. Obesity continued to be a problem of Black females and White males. In general, high blood pressure predominated in Mexican Americans followed by Blacks and Whites, an exception being adult Black males, which had the highest blood pressure level of all groups.

3.0111,
NUTRITIONAL STATUS & FOOD INTAKE PATTERNS AMONG ADOLESCENTS & ELDERLY FROM LOW-INCOME HOUSEHOLDS

J.S. Dinning, State University System of Florida, University of Florida, Agricultural Experiment Station, Dept. of Food Science & Human Nutrition, *Gainesville, Florida* 32601 (0033334)
OBJECTIVE: Determine the nutritional status and food intake patterns of adolescents and elderly from rural and urban predominately black low-income household and identify those major socioeconomic variables which influence them.
APPROACH: Nutritional status will be assessed by dietary intake data, physical examination and biochemical determination of key nutrients in body tissue. Food intake and socioeconomic data will be obtained by home interviews.
PROGRESS: Field work has been completed on two population groups, urban low-income elderly and urban low-income adolescents from Dade County Florida. Incidence of anemia in the elderly was 15%, the anemia was macrocytic, normochromic. Iron nutriture was normal, however, there was a 70% incidence of erythrocyte folacin levels below accepted norms. Approximately 30% of the subjects exhibited serum and/or hair zinc values below accepted norms. Blood levels of vitamins A and C were normal for all subjects. The findings suggest widespread folacin deficiency with no evidence of iron deficiency in this elderly population group. The urban adolescent group exhibited a lower incidence of anemia which was normocytic or microcytic. Serum iron and transferrin saturation values indicated that 8 to 10% of these subjects were iron deficient. These findings demonstrate the importance of determining the nutritional status of specific population groups before formulating intervention programs. The second grant year will be devoted to an analysis of the dietary, clinical and socioeconomic data from the two urban population groups and to field work on a rural adolescent population in Sumter County Florida.

DISTRIBUTION OF VIBRIOS AND RELATED SPECIES, PATHOGENIC AND NON-PATHOGENIC, IN SHELLFISH

R.R. Colwell, University of Maryland, College Park Campus, Graduate School, Dept. of Microbiology, *College Park, Maryland* 20742 (R/P-6)
OBJECTIVES: 1) To determine the incidence and geographical distribution of V. cholera, V. parahaemolyticus and related vibrios in Maryland, Louisiana, and Oregon waters; 2) To determine the environmental parameters governing, or associated with, the distribution of V. cholerae; 3) To determine the presence of V. cholerae and related vibrios in shellfish; 4) To establish the ability of V. cholerae, V. parahaemolyticus and related vibrios to multiply in shellfish, raw and processed, and to investigate potential variation in serotype associated with growth in and on shellfish and in the environment; 5) To develop 'Vibrio Index' (VI) for indicating public health safety of shellfish.
ANTICIPATED BENEFITS: The current outbreak of cholera in Louisiana and the established occurrence of V. cholerae in Chesapeake Bay, Maryland make it imperative for the economic health of the seafood industry in these states to obtain knowledge of the seasonality and microbiology of the pathogenic vibrios. Public education concerning the risks involved and the need for proper handling of seafood at the time of catch, during harvest and processing and prior to consumption should eliminate the potential of serious epidemics and should maintain public trust and confidence in shellfish as a major food staple.
SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Sea Grant Office $68,000

3.0114,
DISTRIBUTION, ISOLATION, & CHARACTERIZATION OF NATURAL MARINE ANTIVIRAL AGENTS (MAVAS) FROM HAWAIIAN OCEAN WATERS & OTHER PACIFIC REGIONS

P.C. Loh, University of Hawaii System, Manoa Campus, School of Arts & Sciences, Dept. of Microbiology, *2444 Dole St., Honolulu, Hawaii* 96822 (WQ/R-6)
OBJECTIVES: 1. To isolate and identify the marine microorganisms which have antiviral activities. 2. To determine the biological, chemical, and physical parameters which would promote the optimal growth of MAVAs in vitro and the conditions under which the virus-inactivating process can be made more effective. 3. To analyze the mechanisms by which viruses are inactivated and the spectrum of human and animal viruses sensitive to the MAVAs. 4. To assess the role of certain environmental parameters in modulating the virus-inactivating capacity of the MAVAs. 5. To determine the conditions for the adaptation of MAVAs to fresh and brackish waters so as to endow any body of water with the capacity to effectively inactivate human enteropathogenic viruses.
ANTICIPATED BENEFITS: Among several anticipated benefits of this study are: (1) the possible utilization of such antiviral microbiological agents in the biological control of contaminating human enteropathogenic viruses and other viruses in the ocean environment and various other bodies of waters; (2) the use of antiviral microorganisms as an alternate method for disinfecting viruses in sewage treatment plants; (3) the rendering of recycled wastewater safe for use in agriculture and mariculture, and preventing the contamination and destruction of marine resources in coastal waters; and (4) the extraction of the antiviral component for application as a potential antiviral drug in the chemotherapy of viral diseases.
The following state and local government agencies have expressed need for data and information concerning the survival of human enteropathogenic viruses in the oceanic environment: Department of Public Works of the City and County of Honolulu, State Department of Health, and the State Division of Fish and Game.
IDENTIFIED BENEFITS TO DATE: The Department of Public Works of the City and County of Honolulu has been receiving information on MAVAs and the survival of human enteropathogenic viruses in Mamala Bay and other oceanic sewage disposal sites.
SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Sea Grant Office $21,000

PCB LEVELS IN HUMAN FLUIDS - SHEBOYGAN CASE STUDY

J. Rankin, University of Wisconsin, Madison Campus, Medical School, Dept. of Preventive Medicine, *450 N. Randall Ave., Madison, Wisconsin* 53706 (R/MW-18)

OBJECTIVES: 1. To establish the range of polychlorinated biphenyl (PCB) contamination of breast milk and blood of Sheboygan area residents. 2. To establish the variation over time of individuals' breast milk and blood levels of PCBs. 3. To determine the relationship between PCB levels and the ingestion of sports fish from Wisconsin waterways, specifically the Sheboygan River. 4. To obtain preliminary data bearing on infant health effects associated with increased maternal PCB body burden.

ANTICIPATED BENEFITS: This study is being done in direct response to the expressed needs of the state Department of Health and Social Services, the Department of Natural Resources, and the city of Sheboygan Health Department. Their concern stems from an incident in which fish from the Sheboygan River were highly contaminated with PCBs leaching into the waterway from a nearby dump site. These studies, in conjunction with the results of ongoing studies in other states, will allow for the proper assessment of risk associated with the consumption of PCB-contaminated fish from the Sheboygan River and other Wisconsin waterways. A data base and experimental logistics will be afforded for the design of expanded studies to determine the effects on infant health of increased maternal PCB body burden.

3.0118,

HUMAN CAPABILITIES IN ACOUSTIC ENVIRONMENTS

C.S. Harris, U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF325120)

Air Force noise environments may affect motor performance, physiological function, thought processes and contribute to fatigue in personnel as well as affecting hearing. Special problems may arise with infrasonic, impulsive, and noncontinuous acoustic energy exposures. This effort is to define noise exposure conditions which degrade and threaten task accomplishment in order to specify safe operating parameters and eventually exposure guidelines. This effort will provide support for the whole body exposure effects standards sections in AFR 161-35.

The approach is to quantify cognitive and psychomotor performance on specific tasks in acoustic environs to such a degree that allowable exposure conditions can be adequately defined. The nature and difficulty of the performance tasks will be varied together with the frequency, duration and intensity of the acoustic stimulus in an effort to identify variables in the stimulus, task or subject that might result in reduced human capabilities. Post-exposure task performance will be examined for continuous and varying acoustic signals. A substantial technology base describing human performance in acoustic environs will be realized when these results are integrated with those from earlier efforts. This work unit is a continuation of work unit 72310903, Human Capabilities in Infrasound, and work unit 72310904, Acoustic Degradation of Human Capabilities. Semiannual review was accomplished 30 Sep 78 in conjunction with the preparation of the technical management review.

PHYSIOLOGICAL INFLUENCES UPON THE WORK PERFORMANCE OF MEN AND WOMEN

G.D. Coates, Old Dominion University, School of Arts & Letters, Dept. of Psychology, *5201 Hampton Blvd., Norfolk, Virginia* 23508 (DF050490)

AF FUNCTION-AIR FORCE OPERATIONS EXPOSE AIRCREW MEMBERS AND OTHER SUPPORT PERSONNEL TO A WIDE VARIETY OF ENVIORNMENTAL STRESS FACTORS WHICH INCLUDE FATIGUE, UNUSUAL WORK CYCLES, THERMAL STRESS, ETC. THESE FACTORS MAY AFFECT MILITARY PERFORMANCE TO A DEGREE THAT WOULD LIMIT AN INDIVIDUAL'S EFFECTIVENESS IN A MAN/ MACHINE SYSTEM. THE RESULTS OF THESE STUDIES SHOULD PROVIDE CAREFULLY CONTROLLED, QUANTITATIVE LABORATORY ASSESSMENTS OF WOMEN'S PERFORMANCE UNDER STANDARD AND NONSTANDARD WORK CONDITIONS AS A MEMBER OF THE MILITARY TEAM. A COMPARISON OF DATA FROM THE PROPOSED STUDY AND DATA ALREADY COLLECTED ON MALES WILL PROVIDE CRUCIAL INFORMATION CONCERNING ANY DIFFERENCES BETWEEN HOMOGENOUS CREWS OF FEMALES AS COMPARED TO MALES. DEFICIENCY-AS MORE AND MORE WOMEN OCCUPY OPERATIONAL POSITIONS, A DATA BASE ON THEIR PHYSIOLOGICAL CAPABILITIES AND LIMITATIONS IS REQUIRED. OBJECTIVE-THIS EFFORT WILL EXPLORE THE EFFECTS OF THE OVARIAN CYCLE AND THE SEX OF THE SUBJECT ON WORK PERFORMANCE. THE PRIMARY FOCUS OF THE RESEARCH IS ON THE EFFECTS OF OVARIAN CYCLING ON THE WORK PERFORMANCE OF WOMEN, INCLUDING AN ASSESSMENT OF THE INTERACTIVE EFFECTS OF MENSTRUATION WITH A STRESSOR KNOWN TO PRODUCE DECREMENTS IN WORK PERFORMANCE, CONTINUOUS WORK, AND CONSEQUENT SLEEP LOSS. COMPARISON OF THE DATA OBTAINED ON FEMALE SUBJECTS TO THAT OF OTHER STUDIES USING MALE SUBJECTS EMPLOYING THE SAME WORK SITUATION, PREVIOUSLY CONDUCTED BY PERSONNEL OF THIS LABORATORY, WILL PERMIT SOME ASSESSMENT OF THE EFFECTS OF SEX ON WORK PERFORMANCE AS WELL. HOW RESEARCH CONTRIBUTES-THIS RESEARCH CONTRIBUTES DIRECTLY TO RO 1.5, 'AEROSPACE MEDICINE' AND RO 1.6, 'HABITABLE CREW ENVIRONMENTS IN AIR FORCE OPERATIONS'.

THE RESEARCH WILL BE CONDUCTED UTILIZING THE STANDARDIZED PROCEDURES OF THE SYNTHETIC-WORK APPROACH TO PERFORMANCE ASSESSMENT. IT EMPLOYS A MULTIPLE-TASK PERFORMANCE BATTERY (MTPB) TO CREATE WITHIN THE LABORATORY A SYNTHETIC-WORK SITUATION IN WHICH SYSTEMATIC ASSESSMENTS OF WORK BEHAVIOR CAN BE MADE.

3.0120,

24-HOUR MEAN PLASMA HORMONE LEVELS IN MEN WITH CORONARY HEART DISEASE

B. Zumoff, Montefiore Hospital & Medical Center, *111 E. 210th St., Bronx, New York* 10467 (DF051630)

AF FUNCTION-CORONARY HEART DISEASE IS A SERIOUS, WIDESPREAD MEDICAL AND PUBLIC HEALTH PROBLEM THAT IS OF PARTICULAR CONCERN TO THE USAF BECAUSE IT RESULTS IN THE LOSS OF MANY VIGOROUS AND RELATIVELY YOUTHFUL MEN FROM FLYING DUTIES AND OTHER MILITARY ASSIGNMENTS. THE AF HAS RECOGNIZED THE SERIOUSNESS AND MAGNITUDE OF THIS PROBLEM BY INSTITUTING BOTH RESEARCH STUDIES, SUCH AS THE LONG-TERM BLOOD LIPID FOLLOW-UP PROGRAM, AND CLINICALLY-ORIENTED LARGE-SCALE RISK MODIFICATION STUDIES, E.G., THE RECENTLY-APPROVED HEART (HEALTH EVALUATION AND RISK TABULATION) PROGRAM. THE RATIONALE FOR THESE STUDIES RESTS LARGELY ON THE PREMISE THAT COUNTERACTING OR MITIGATING THE KNOWN 'MAJOR RISK FACTORS' FOR CORONARY HEART DISEASE, NAMELY SMOKING, HYPERLIPIDEMIA AND HYPERTENSION, WOULD DIMISH THE INCIDENCE AND PREVALENCE OF CORONARY HEART DISEASE IN USAF PERSONNEL. DEFICIENCY-EPIDEMIOLOGICAL STUDIES HAVE SHOWN THAT 'CLASSICAL' RISK FACTORS ACCOUNT IN THE AGGREGATE FOR ONLY ABOUT ONE-HALF OF THE INCIDENCE OF CORONARY HEART DISEASE IN HIGH-INCIDENCE POPULATIONS SUCH AS THAT OF THE UNITED STATES. THUS EVEN IF IT WERE POSSIBLE TO DECREASE ALL OF THESE FACTORS SIMULTANEOUSLY, AS THE USAF HEART PROGRAM PROPOSES AN EXCESSIVE INCIDENCE OF CORONARY HEART DISEASE WOULD REMAIN AS A SERIOUS HEALTH PROBLEM. IT APPEARS ESSENTIAL THEREFORE, TO DEVELOP NEW HYPOTHESES TO ACCOUNT FOR THE REMAINDER OF THIS EXCESS INCIDENCE OF CORONARY HEART DISEASE IN ORDER TO DEVISE APPROPRIATE METHODS FOR PREVENTION AND TREATMENT. OBJECTIVE-THE HYPOTHESIS UNDERLYING THIS RESEARCH IS THAT ABNORMALITIES OF THE ENDOCRINE ENVIRONMENT IN MAN PREDISPOSE TO THE DEVELOPMENT AND/OR PROGRESSION OF CORONARY HEART DISEASE. IF THIS IS SO, IT SHOULD BE POSSIBLE TO DEVELOP NEW AND EFFECTIVE PHARMACOLOGICAL THERAPY (WITH HORMONES, HORMONE METABOLITES, OR DRUGS CAPABLE OF ALTERING THE BLOOD LEVELS OF HORMONES OR HORMONE METABOLITES OR ANTAGONIZING THEIR EFFECTS) THAT COULD ACCOMPLISH BOTH PRIMARY AND SECONDARY PREVENTION OF MYOCARDIAL INFRACTION. HOW CONTRIBUTES-CONTRIBUTES DIRECTLY TO AUBAREA 1.4.

PLANS ARE TO IDENTIFY WHATEVER DIFFERENCES IN PLASMA HORMONE CONCENTRATIONS THERE MAY BE BETWEEN MEN WITH AND WITHOUT CORONARY HEART DISEASE. TO ACHIEVE THIS, THE INVESTIGATORS WILL RIGOROUSLY DEFINE THE DISEASE-POSITIVE AND DISEASE-NEGATIVE POPULATIONS AND THEN CARRY OUT AN EXHAUSTIVE 'CROSS-SECTIONAL' COMPARISON OF THE HORMONAL STATUS OF THESE TWO POPULATIONS, USING A LARGE NUMBER OF PARAMETERS, METHODS (TEXT TRUNCATED - EXCEEDS CAPACITY)

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research $33,500

G-RELATED PATHOLOGY IN AF PERSONNEL EXPOSED TO HIGH-G STRESS

K.K. Gillingham, U.S. Dept. of Defense, Air Force, School of Aerospace Medicine, *Brooks Air Force Base, San Antonio, Texas* 78235 (DF319710)

TO DETERMINE THE MAGNITUDE, DURATION AND OTHER PARAMETERS OF THE STRESS TO WHICH AIRCREW OF HIGH-PERFORMANCE FIGHTER/ ATTACK AIRCRAFT ARE EXPOSED DURING AERIAL COMBAT, AND TO DETERMINE THE PHYSIOLOGIC AND PATHOLOGIC RESPONSES TO THIS STRESS.

INFLIGHT RECORDINGS OF G STRESS, ECG, RESPIRATORY FLOW AND OTHER MEASUREMENTS WILL BE OBTAINED FROM PILOTS OF F-15, F-16, AND OTHER HIGH-PERFORMANCE AIRCRAFT DURING AIR COMBAT TRAINING. BLOOD AND URINE OF PILOTS AND HUMAN CENTRIFUGE RIDERS WILL BE QUANTITATIVELY ANALYZED FOR LEVELS OF CATECHLOAMINES AND OTHER STRESS HORMONES TO DETERMINE THE RELATIVE PHYSIOLOGIC AND BIOCHEMICAL EFFECTS OF DIFFERENT TYPES OF G STRESS.

SUPPORTED BY U.S. Dept. of Defense, Air Force, School of Aerospace Medicine funds n.a.

3.0122,

PROTECTIVE EQUIPMENT EFFECTS ON GROUND CREW PERFORMANCE EQUIPMENT FOR ESTABLISHMENT OF PHYSIOLOGICAL STANDARDS

L.G. Myhre, U.S. Dept. of Defense, Air Force, School of Aerospace Medicine, *Brooks Air Force Base, San Antonio, Texas* 78235 (DF322680)

TO DEVELOP INTEGRATED SYSTEM DESIGN CRITERIA FOR FIREFIGHTERS' PROTECTIVE GARMENTS AND BREATHING APPARATUS, BASED ON PHYSIOLOGIC REQUIREMENTS AND LIMITATIONS. ACKNOWLEDGED COMPLAINTS OF FIREFIGHTERS INCLUDE THE WEIGHT, BULK, LIMITED USE IME AND QUESTIONABLE EFFICIENCY OF THE BREATHING APPARATUS. NO STUDY TO DATE HAS QUANTITATED THE PHYSIOLOGIC CONSEQUENCES OF USING COMMERCIALLY AVAILABLE RESPIRATORS OVER A BROAD RANGE OF WORKLOADS. METABOLIC REQUIREMENTS AND WEIGHT PENALTIES OF PERFORMING OPERATIONAL TASKS SUCH AS CLIMBING, LIFTING AND BENDING WHILE WEARING A FIREFIGHTERS' LIFE SUPPORT AND PROTECTIVE EQUIPMENT HAS NOT BEEN ASSESSED. INTERACTIVE EFFECTS OF THERMAL STRESS IMPOSED BY PROTECTIVE EQUIPMENT, EXTERNAL HEAT LEADS AND METABOLIC AND RESPIRATORY STRESS IMPOSE PHYSIOLOGIC LIMITATIONS ON FIREFIGHTERS AND REDUCE ENDURANCE. SPECIFIC OBJECTIVES OF THIS EFFORTS ARE TO QUANTITATE THE REDUCTION IN WORK CAPACITY EFFECTED BY THE WEIGHT OF A SELF-CONTAINED RESPIRATOR AND PROTECTIVE CLOTHING, TO ASSESS ADDITIONAL PHYSIOLOGIC EFFECTS OF THERMAL STRESS AND RESPIRATOR LIMITATIONS, AND TO BUILD AN APPROPRIATE PHYSIOLOGIC DATA BASE REQUIRED TO ESTABLISH EQUIPMENT DESIGN CRITERIA.

TWENTH SUBJECTS INCLUDING SMOKERS AND NON-SMOKERS WILL PERFORM TREADMILL EXERCISE OVER A WIDE RANGE OF WORKLOADS AND WILL PERFORM OTHER TASKS SUCH AS CLIMBING, BENDING AND LIFTING. EKG, HEART RATE, 02 AND CO2 CONCENTRATIONS, BREATHING RESISTANCE, PEAK FLOWS, SKIN AND CORE TEMPERATURES WILL BE MONITORED CONTINUOUSLY. 02 CONSUMPTION, PULMONARY VENTILATION, AND BLOOD LACTATE AND CARBOXYHEMOGLOBIN CONCENTRATIONS WILL BE DETERMINED. ENDURANCE DECREMENTS AND PHYSIOLOGIC LIMITATIONS IMPOSED BY A SELF-CONTAINED RESPIRATOR AND/OR WEARING FIREFIGHTERS' PROTECTIVE CLOTHING WILL BE ASSESSED. BOTH THERMAL AND RESPIRATORY STRESSES WILL BE CONSIDERED.

SUPPORTED BY U.S. Dept. of Defense, Air Force, School of Aerospace Medicine funds n.a.

3.0123,

TECHNIQUES FOR ASSESSING G-RELATED PATHOLOGY IN PILOTS OF HIGH-PERFORMANCE AIRCRAFT

E.B. Smith, Technology Inc., *16821 Buccaneer, Suite 206, Houston, Texas* 77058 (DF323760)

The myocardial infarctions that go unrecognized each year in the general population and the cardiomyopathy and subendocardial hemorrhage detected recently in swine exposed to acceleration stress make it imperative to develop a diagnostic tool to detect this damage if it exists in aircrew of high performance aircraft. An analytical biochemical technique that correlates with myocardial injury will be developed.

The experimental protocol of this task is divided into four parts-(1) select the most appropriate analytical method for serum creatine phosphokinase isoenzymes and other chemical indicators to validate myocardial injury, (2) correlate laboratory induced myocardial injury with these selected chemical indicators, (3) correlate myocardial damage resulting from plus gz acceleration stress as in part 2, and (4) compare changes in isoenzymes concentrations in human subjects exposed to plus gz acceleration.

SUPPORTED BY U.S. Dept. of Defense, Air Force, School of Aerospace Medicine funds n.a.

3.0126,

ADVERSE DRUG REACTIONS IN THE PEDIATRIC AGE

F.G. Mullick, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306

The purpose of this study is to continue the investigation on all cases under eighteen years of age with drug-induced disease available in the files of the Institute in regard to both clinical and pathologic spectrum of the disease. To date, there are 600 pediatric cases in file. Clinico-pathologic studies on the first 200 patients have been finished and published. The remaining 400 cases are being studied to evaluate drug-related cases. Results on the remaining 400 cases are consistent with the first group. Like in the adult, all organ systems can be affected, and a large variety of therapeutic drugs can cause adverse reactions. Preliminary results indicate that the liver is the organ most commonly affected and that antibiotics are the type of drug most commonly causing adverse drug reactions in children.

A group of approximately 25 cases of Ferrous Sulfate poisoning and another of 22 cases of Salicylate poisoning have been selected to be studied in detail.

BIBLIOGRAPHIC REFERENCES: Mullick, F.G.: Sulfamylon Pneumonits in Children. Military Medicine, 144: 180, 1979.

CARDIOVASCULAR ADVERSE DRUG REACTIONS

F.G. Mullick, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306

The purpose of this study is to continue the investigation on the injurious effect of both cardiac and non-cardiac therapeutic drugs on the heart.

A large series of cases are being studied by histologic methods. The narrative summaries, autopsy protocols and gross specimens are also being reviewed to study cases with an alleged drug reaction.

Results indicate that the type of vasculitis as well as the type of myocarditis seen in adverse drug reaction is specific. All the drug related lesions have been included under the term 'drug related vasculitis' and 'drug' related myocarditis.' The vasculitis is quite distinctive from the one seen in serum-sickness, periarteritis nodosa, collagen diseases and infections, and the myocarditis is quite distinctive from the one seen in infections. The myocarditis has been classified in two groups: Group I: Hypersensitivity Myocarditis and Group II: Toxic Myocarditis.

THERAPEUTIC DRUGS AND THEIR EFFECT ON THE FETUS

F.G. Mullick, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306

The purpose of this study is to continue the general review of all cases in which maternal therapy during pregnancy has affected the fetus. The 22 cases that were collected are still under study.

Preliminary results indicate that a wide variety of drugs can cross the placental barrier and might affect the fetus. Our series of cases fall in two broad groups. Group one are the patients who developed fetal distress following maternal medication during labor. Group two are the patients who were born with congenital anomalies and whose mothers received medications during pregnancy.

The relationship between these series of drugs and the aforementioned effects on their offspring is under study. The results are very preliminary, and a definite relationship between the drugs and the alleged reactions in these fetuses has not been established as yet.

The follow-up study initiated last year requesting a more complete prenatal history has not been completed.

3.0131,

CARCINOMA OF THE ENDOMETRIUM

H.J. Norris, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306

The diagnosis and management of endometrial hyperplasia, including atypical hyperplasia, for the past 50 years has been one of the most controversial subjects in gynecologic pathology and gynecology. Criteria are poorly defined and confusion exists due to the use of the same terms by pathologists for markedly different lesions. The natural history of endometrial hyperplasia has still not been delineated. These aspects should be classified by our study.

Five hundred cases of endometrial hyperplasia have been obtained from the AFIP files over a 30-year period ending in 1970. These cases are all military, the diagnosis having been made on endometrial curettings only. We would like to determine the fate of these patients after their curettage. Does the hyperplasia regress or does it progress to more advanced hyperplasia or carcinoma? We would like to review the slides if any additional surgical procedures such as a repeat curettage or hysterectomy was performed. It is only through such a 'prospective' analysis that the natural history of endometrial hyperplasia can be determined and the criteria for what constitutes the precursors of endometrial carcinoma defined.

The cases in the AFIP files have been reviewed and the 500 examples of endometrial carcinoma are in the process of being forwarded to the follow-up unit.

SUDDEN INFANT DEATH SYNDROME

K. Kagan Hallet, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306

Each case of Sudden Infant Death Syndrome (SIDS) is added to the Pediatric Pathology Registry files following study of the slides and protocol. SIDS is a puzzle to pediatricians and neonatologists, as well as to pathologists. None of the several histologic findings initially thought to be either pathognomic for SIDS or related to its supposed pathogenesis have been reproducible by subsequent experimentation. Recent articles have emphasized subtle degenerative lesions in the brainstems (particularly medullae) of affected children. Some of these 'lesions' are described by a non-neuropathologist and are not very convincing. Others are more striking lesions, suggesting long-term hypoxia. Perhaps the latter group of infants does not conform to the definition of SIDS patients as ostensibly healthy babies who gasp and die (i.e., the lesions are 2 degrees not primary).

SIDS cases will continue to be accessioned in the Registry and studied carefully. It is suspected that the patient group may be heterogeneous and that the answer may be found by studying an at-risk infant population prospectively rather than attempting to demonstrate the cause of respiratory failure in the deceased individual.

STATISTICAL CORRELATIONS OF CLINICAL, EPIDEMIOLOGIC & HISTOPATHOLOGIC INFORMATION ON LEPROSY PATIENTS FROM ZAIRE

W.M. Meyers, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306

The clinical, histopathologic, bacteriologic and lepromin reaction data were analyzed on 429 leprosy patients treated at the Institut Medical Evangelique, Kimpese, Zaire. All but 30 of the patients were Kikongo speaking.

There was complete agreement between the clinical and histopathologic diagnoses in 77.2% of the patients and an additional 21.4% of the patients differed by only one group in the Ridley-Jopling System (International Journal of Leprosy 20:255-273, 1966). The contingency coefficient for this comparison was 0.705. The Mitsuda reactions (x in mm) versus clinical diagnoses were as follows: polar lepromatous (LL) - 1.8; borderline-lepromatous(BL) - 3.6; borderline (BB) - 6.8; boderline-tuberculoid (BT) - 9.6, and polar tuberculoid (TT) -10.9. The Mitsuda reactions versus histopathologic diagnoses were similar and all groups differed significantly at the 5% level or less. The Bacterial indices (x) versus histopathologic diagnoses were: TT -0.01; BT - 0.04; BB - 0.11; BL - 1.18, and LL - 2.73. Thus, the primary parameters of the Ridley-Jopling System correlate well with the anticipated findings.

The Fernandez reactions and Mitsuda reactions were compared with the class of leprosy and the following correlations were obtained (Pearson's correlation coefficient): TT - 0.60; BT - 0.52; BB - 0.14; BL - 0.12 and LL - 0.29. Thus the Fernandez reactions vary increasingly independent of the Mitsuda reaction toward the lepromatous end of the spectrum of leprosy. This suggests that the Fernandez reaction is the result of sensitization to mycobacterial antigens that cross react with Mycobacterium leprae. This reactivity is not as strikingly suppressed in BB-B1 patients as in the Mitsuda Reaction.

BIBLIOGRAPHIC REFERENCES: Meyers, W.M., Heggie, C.D., Kay, T.L., Staple, E.M., and Kvernes, S.: The Ridley-Jopling Five-Group Classification of Leprosy-Correlations of Parameters of the Classification in 1,429 Leprosy Patients. Int. J. of Lepr. 47: 683-684, 1979.

CARCINOMA OF OVARY

H.J. Norris, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306

An immunohistochemical study of human chorionic gonadotropin (HCG) and alpha-fetoprotein (AFP) in malignant germ cell tumors of the ovary was published in collaboration with the National Cancer Institute in an effort to correlate the type of neoplasm with the presence of markers. The results were published in Ann. Clin. Lab. Sci. 9: 462-466, 1979.

A manuscript has been submitted to Cancer on Sertoli tumors of the ovary. These 29 cases are a special group that have not had ultrastructural features characterized.

Two hundred granulosa tumors have been collected and sent for follow-up in an effort to find out what the prognosis is after ten years of follow-up.

Results of a collaborative epidemiologic study conducted in cooperation with George Washington University was published: McGowen, L., et al. The Women at Risk for Ovarian Cancer. Gynecol. Oncol. 7:325-344, 1979.

A collaborative study with the Gynecologic Oncology Group has led to submission of a paper to Gynecol. Oncology for publication in the near future.

Two book chapters reviewing the AFIP experience with germ cell tumors of the ovary have also been completed. These will appear in Bloodworth's Endocrine Pathology and Coppleson's Textbook of Gynecologic Oncology.

A STUDY OF NON-COMBAT DEATHS IN A COMBAT ZONE

R.L. Thompson, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306

Within the files of the Institute, there is a group of 2,700 cases of deaths that occurred in Vietnam during the period 1966-1972. The majority of these cases are deaths due to non-combat causes. The cause and manner of the non-combat deaths will be evaluated, and this data will be compared to a U.S. city or area of comparable population. The objective of the project is to evaluate similarities and differences between non-combat deaths in a combat zone and deaths in a U.S. city of comparable population. The study may be able to identify certain non-combat problems that have not previously been realized.

During the past year, the demographic data from all the cases, along with the causes and manners of deaths, have been recorded on work sheets. The computer analysis of the data has begun but has not been completed. From Department of Defense data, it has been determined that during the period 1966-1972, there was an average number of approximately 400,000 U.S. Military personnel in Vietnam, and an appropriate U.S. city of comparable population is being sought for comparison.

LIFE SUPPORT EQUIPMENT RETRIEVAL PROGRAM (DA0C6897)

T.A. Hundley, U.S. Dept. of Defense, Army, Medical Research & Development Command, Field Research & Biomedical Applications Div., *Fort Rucker, Alabama* 36362 (DA0G0167)

To provide a technological data base concerning the physiological and biomedical aspects of the evaluation and injury correlation of life support equipment, identification of hazard protection problems associated with life support equipment and to provide conceptual design recommendations and criteria for the improvement of life support equipment.

Army aviation life support equipment involved in either injury causation or prevention, in field, are sent to USARL for biomedical and injury correlation evaluation. This evaluation assesses the effectiveness/deficiencies of the life support equipment through an analysis of the physical condition of the protective devices, the human injury incurred and the related human dynamics involved in the accident. The analysis is accomplished by the application of epidemiologic methods incorporating medically related engineering failure mode analysis, accident investigative procedures, forensic pathology, mathematical modeling and applied bioengineering research techniques.

SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Aeromedical Research Lab. funds n.a.

DEVELOPMENT AND EVALUATION OF CRITERIA FOR ADVANCED WASTEWATER TREATMENT PROCESSES AT MILITARY INSTALLATIONS

C.I. Moss, U.S. Dept. of Defense, Army, Medical Research & Development Command, Medical Bioengineering Research & Development Lab., *Fort Detrick, Frederick, Maryland* 21701 (DA0A6947)

PROVIDE ADVANCED WASTEWATER TREATMENT (AWT) TECHNOLOGY APPLICABLE TO US ARMY WASTEWATER TREATMENT PLANTS SO THAT NPDES PERMIT LIMITATIONS UNDER PL 92-500 CAN BE MET. DESIGN CRITERIA WILL BE ESTABLISHED FOR SELECTED PROCESSES WITH INITIAL EMPHASIS ON ORGANIC LOADING RATES AND NITROGEN REMOVAL PROCEDURES. EVALUATION OF PHOSPHORUS REMOVAL TECHNIQUES AND THE PROCESSING OF THE RESULTANT CHEMICALLY TREATED EFFLUENT ARE CONSIDERED IN RELATION TO UPGRADING EXISTING WASTE TREATMENT FACILITIES. THE APPLICABILITY OF COMBINING CARBON AND NITROGEN OXIDATION PROCESSES WILL BE EVALUATED TO DETERMINE ITS IMPACT ON UPGRADING US ARMY WASTEWATER FACILITIES.

PILOT-SCALE STUDIES WILL BE CONDUCTED ON SELECTED ADVANCED WASTEWATER TREATMENT PROCESSES AND PROBLEMS. EMPHASIS WILL BE PLACED ON UPGRADING EXISTING FACILITIES, RATHER THAN ATTEMPTING TO DEVELOP PROCESSES AND PROCEDURES FOR TOTALLY NEW TREATMENT PLANTS. THE GOAL WILL BE TO SATISFY NPDES PERMIT LIMITATIONS FOR DESIGNATED POLLUTANTS, AS OPPOSED TO ATTEMPTING TO OBTAIN DESIGN CRITERIA FOR EXTREMELY LOW POLLUTANT LEVELS. LABORATORY AND BENCH-SCALE STUDIES WILL BE CONDUCTED IN SUPPORT OF PILOT SCALE OPERATIONS.

DEVELOPMENT OF SURVEY METHODOLOGY FOR ANALYSIS OF ENVIRONMENTAL MEDICAL SYMPTOMS AND RISK IN ARMY PERSONNEL

J.B. Sampson, U.S. Dept. of Defense, Arn ,, Medical Research & Development Command, Research Inst. of Environmental Medicine, *Natick, Massachusetts* 01760 (DA0C6129)

THE NUMBER AND TYPE OF ARMY PERSONNEL WHO ARE SUBJECTED TO ENVIRONMENTALLY INDUCED ILLNESS AND INJURY ARE NOT AVAILABLE FROM THE CURRENT MEDICAL RECORDS SYSTEM. DATA ARE NEEDED ON THOSE EXPOSED AS WELL AS THOSE TREATED, ON PARTIALLY DISABLING SYMPTOMS WHICH MAY GO UNREPORTED, ON THE NATURE OF EXPOSURE (ESPECIALLY AS RELATED TO MOS DUTIES) AND ON MEDICAL RISK FACTORS DUE TO INDIVIDUAL BACKGROUND, PHYSICAL CONDITION AND HEALTH-RELATED BEHAVIORS. SUCH DATA, OBTAINED FROM AND PUBLISHED IN TERMS OF ACTUAL ARMY POPU-LATIONS, WILL BE VALUABLE IN FOCUSING RESEARCH, PROPHYLAXIS AND TRAINING. IT WILL BE OF DIRECT USE TO OPERATIONAL PLANNERS, FIELD COMMANDERS, AND POTENTIALLY EFFECTED INDIVIDUALS. AT THE END OF THE DEVELOPMENTAL PROCESS IT IS EXPECTED THAT THE PERFECTED SURVEY PROCEDURES WILL BE USED OR APPLIED TO WORK UNITS DEDICATED TO THE ANSWERING OF SPECIFIC QUESTIONS.

DEVELOP AND FIELD TEST SPECIFIC METHODOLOGY FOR DATA COLLECTION AND ANALYSIS FROM ARMY PERSONNEL WHO ARE EXPOSED TO CLIMATIC EXTREMES AND/OR SUSTAINED OPERATIONS DURING FIELD MANEUVERS, SPECIAL TRAINING, OR TRANSMERIDIAN DEPLOYMENTS AND TO RIGOROUS PHYSICAL FITNESS PROGRAMS. METHODOLOGY INCLUDES QUESTIONNAIRES, INTERVIEWS AND BEHAVIORAL OBSER-VATIONS DESIGNED TO OBTAIN SUBJECTIVE AND OBJECTIVE DATA ON ILLNESS AND INJURY DURING FIELD OPERATIONS, AS WELL AS RELEVANT BACKGROUND INFORMATION. THE METHODOLOGY WILL ALSO BE USED IN CONTROLLED LABORATORY EXPERIMENTS WHERE CLIMATIC CONDITIONS ARE MANIPULATED. SURVEY SAMPLING STATISTICS WILL BE APPLIED TO DETERMINE CONFIDENCE LEVEL IN THE OBTAINED SAMPLES. DEVELOPMENT INVOLVES TRAINING OF PERSONNEL AND THE DESIGN, PRETEST, SAMPLE TEST, REVISION AND VALIDATION OF THE SURVEY INSTRUMENTS. DATA OBNTAINED WILL BE DESCRIBED IN TERMS OF PERCENT OR PERCENTILES IN SELECT ARMY SUBPOPULATIONS FOR EACH RELEVANT OR CLEARLY IDENTIFIABLE CLIMATIC CONDITION. WORK UNIT WILL CONSULT WITH MILPERCEN, OTSG'S PATIENT ADMINISTRATIVE DIVISION.

SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Research Inst. of Environmental Medicine funds n.a.

3.0146,

SURVEY ANALYSIS OF ENVIRONMENTAL MEDICAL SYMPTOMS AND RISK IN ARMY PERSONNEL

J.B. Sampson, U.S. Dept. of Defense, Army, Medical Research & Development Command, Research Inst. of Environmental Medicine, *Natick, Massachusetts* 01760 (DA0C6132)

DATA IS NEEDED ON THE NUMBER AND TYPE OF ARMY PERSONNEL WHO SUFFER ENVIRONMENTALLY-INDUCED ILLNESS AND INJURY, ON THERAPIES USED AND THEIR EFFECTIVENESS, ON TROOPS EXPOSED BUT NEVER REQUIRING TREATMENT, ON PARTIALLY DISABLING SYMPTOMS WHICH MAY GO UNREPORTED, ON THE NATURE OF EXPOSURE (ESPECIALLY AS RELATED TO MOS DUTIES) AND ON MEDICAL RISK FACTORS DUE TO INDIVIDUAL BACKGROUND, PHYSICAL CONDITION AND HEALTH-RELATED BEHAVIORS. SUCH DATA, OBTAINED FROM AND PUBLISHED IN TERMS OF ACTUAL ARMY POPULATIONS, WILL GIVE FOCUS TO RESEARCH, PROPHYLAXIS AND TRAINING, AND BE OF DIRECT USE TO OPERATIONAL PLANNERS, COMMANDERS, AND AT-RISK INDIVIDUALS.

DEVELOP AND FIELD TEST SPECIFIC METHODOLOGIES FOR DATA COLLECTION AND ANALYSIS FROM ARMY PERSONNEL WHO ARE EXPOSED TO CLIMATIC EXTREMES AND/OR SUSTAINED OPERATIONS DURING FIELD MANEUVERS, SPECIAL TRAINING, OR TRANSMERIDIAN DEPLOYMENTS AND TO RIGOROUS PHYSICAL FITNESS PROGRAMS. METHODOLOGY INCLUDES

QUESTIONNAIRES, INTERVIEWS RECORD SURVEYS AND BEHAVIORAL OBSERVATIONS DESIGNED TO OBTAIN SUBJECTIVE AND OBJECTIVE DATA ON ILLNESS AND INJURY AS WELL AS RELEVANT BACKGROUND INFORMATION. THE METHODOLOGY WILL ALSO BE USED IN CONTROLLED LABORATORY EXPERIMENTS WHERE CLIMATIC CONDITIONS ARE MANIPULATED. DEVELOPMENT INVOLVES COORDINATION WITH OTHER AGENCIES, TRAINING OF PERSONNEL AND THE PRETEST, SAMPLE TEST, REVISION AND VALIDATION OF SURVEY INSTRUMENTS. SURVEY SAMPLING STATISTICS WILL BE APPLIED TO DETERMINE CONFIDENCE LEVEL AND TO DESCRIBE SUBJECTS IN TERMS OF PERCENTILES IN SELECT ARMY SUBPOPULATIONS. IT IS EXPECTED THAT THE PERFECTED PROCEDURES WIL BE USED IN APPLIED WORK UNITS.

PATHOLOGIC MANIFESTATIONS OF ZOONOTIC DISEASES OF MILITARY IMPORTANCE

A.J. Johnson, U.S. Dept. of Defense, Army, Medical Research & Development Command, Div. of Pathology, *Washington, District of Columbia* 20012 (DA0B6537)

TO STUDY AND DEFINE THE PATHOGENESIS OF EXPERIMENTAL TRYPANOSOMIASIS, LEISHMANIASIS, AND SARCOCYSTOSIS AND THE EFFECTS OF OTHER INFECTIOUS, TOXIC, AND ENVIRONMENTAL BIOHAZARDS IN A VARIETY OF ANIMAL HOSTS. PROVIDE MORPHOLOGIC PATHOLOGY SUPPORT FOR WILDLIFE EPIDEMIOLOGIC SURVEYS IN THE TRANSAMAZON AND OTHER MILITARY INSTALLATIONS. PROVIDE DIAGNOSTIC PATHOLOGY FOR ANIMALS ACQUIRING SPONTANEOUS DISEASES AND DEATHS DURING QUARANTINE OR COLONIZATION AT THE WALTER REED ARMY INSTITUTE OF RESEARCH. PROVIDE THE PATHOLOGY PARAMETER FOR QUALITY ASSURANCE OF LABORATORY ANIMALS REARED IN THE ANIMAL FACILITY OF THE WRAIR AND THOSE ACQUIRED ON CONTRACT. PROVIDE MORPHOLOGIC PATHOLOGY, ULTRASTRUCTURAL MICROSCOPY, AND IMMUNOPATHOLOGY IN AN INVESTIGATIVE STUDY OF SPONTANEOUS, SEVERE RENAL DISEASE AND DEATHS IN COLONIZED AOTUS MONKEYS. ALL PROJECTS ARE GENERATED FROM APPROVED PROTOCOLS AND ARE RELATED TO MILITARY MEDICAL PROBLEMS.

STUDIES UTILIZE CONVENTIONAL GROSS AND HISTOPATHOLOGY, CLINICAL PATHOLOGY, HISTOCHEMISTRY, IMMUNOHISTOCHEMISTRY AND ELECTRON MICROSCOPIC TECHNIQUES.

SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research funds n.a.

3.0150,

MENINGOCOCCUS- BACTERIOLOGICAL, SEROLOGICAL AND EPIDEMIOLOGICAL STUDIES.

H.A. Feldman, State University of New York, Upstate Medical Center, School of Medicine, Dept. of Preventive Medicine, *766 Irving Ave., Syracuse, New York* 13210 (DA0A7318)

THIS STUDY INCLUDES DOCUMENTATION OF THE SULFONAMIDE RESISTANCE OF STRAINS OF MENINGOCOCCUS OBTAINED FROM ALL OVER THE WORLD, DEVELOPMENT OF ADEQUATE SEROLOGIC AND IMMUNOLOGIC METHODS FOR STUDY OF THESE INFECTIONS, THE STANDARDIZATION OF TECHNIQUES FOR USE IN COMPREHENSIVE STUDIES OF MENINGOCOCCAL INFECTIONS, AND A CONTINUING SEARCH FOR NEW DRUGS TO PROVIDE MASS CONTROL OF INFECTIONS. STUDIES OF THIS NATURE PROVIDE TO THE MILITARY THE ABILITY TO BETTER UNDERSTAND THE PATHOGENESIS OF MENINGOCOCCAL MENINGITIS, A DISEASE THAT HAS BEEN COMMONPLACE IN RECRUIT POPULATIONS.

APPROACH - STRAINS OF MENINGOCOCCI ARE OBTAINED FROM MILITARY AND CIVILIAN SOURCES WORLDWIDE. SEROLOGIC TYPING AND CONVENTIONAL ANTIBIOTIC TESTING ARE EMPLOYED. A CONTINUING SEARCH IS MAINTAINED FOR NEW DRUGS AND ANTIBIOTICS TO DETERMINE THEIR IN VITRO EFFECT UPON MENINGOCOCCI. ANY THAT APPEAR TO BE POTENTIALLY USEFUL ARE THEN EVALUATED FURTHER UP THROUGH THE LEVEL OF LIMITED FIELD TRIALS.

BIOLOGICAL STUDIES OF INSECT INFECTION AND DISEASE TRANSMISSION
C.L. Bailey, U.S. Dept. of Defense, Army, Medical Research & Development Command, Communicable Disease & Immunology Research Div., *Washington, District of Columbia* 20012 (DA0A6514)
DEVELOP PHYSIOLOGICAL MEANS OF INTERRUPTING MALARIA TRANSMISSION THROUGH AN UNDERSTANDING OF FACTORS AFFECTING PARASITE INFECTIVITY IN VIVO AND IN VITRO. DETERMINE MOST EFFECTIVE MEANS OF INHIBITING MALARIA INFECTIONS IN VERTEBRATE HOSTS BY INJECTION OF LIPOSOMES CONTAINING GLYCOLIPIDS. DEVELOP MODELS FOR CYCLICAL TRANSMISSION OF AFRICAN TRYPANOSOMIASIS TO FACILITATE UTILIZATION OF LARGE NUMBERS OF PARASITES IN STUDYING IMMUNE MECHANISMS. REALIZATION OF OBJECTIVES MAY LEAD TO PREVENTION OR CONTROL OF MALARIA AND TRYPANOSOMIASIS IN MILITARY TROOPS.
ASSAY LIPOSOME PREPARATIONS, LACKING OR CONTAINING ANTIMALARIAL DRUGS FOR EFFECTIVENESS IN INHIBITING MALARIA INFECTIONS. ISOLATE DIFFERENT STAGES OF THE MALARIA PARASITE ON DENSITY GRADIENTS FOR SUBSEQUENT STUDY IN CULTURE SYSTEMS. CORRELATE RECENTLY DEVELOPED CYCLICAL TRANSMISSION MODELS FOR TSETSE FLIES WITH PHYSIOLOGICAL FACTORS THAT AFFECT FLY TRYPANOSOME INTERACTIONS. EVALUATE A SELF MATING STRAIN OF ANOPHELES BALABACENSIS FOR USE IN LABORATORY TRANSMISSION OF MALARIA.
SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research funds n.a.

3.0157,
EPIDEMIOLOGICAL STUDIES OF MILITARY DISEASES
R.N. Miller, U.S. Dept. of Defense, Army, Medical Research & Development Command, Preventive Medicine Div., *Washington, District of Columbia* 20012 (DA0B6489)
TO IDENTIFY, DEFINE, AND STUDY KNOWN AND POTENTIAL CAUSES OF DISABILITY IN MILITARY POPULATIONS USING RELEVANT, EXISTING UEPIDEMIOLOGIC TECHNIQUES AND DEVELOPING APPROPRIATE NEW METHODOLOGY. TO APPLY THIS INFORMATION TO THE PREVENTION AND CONTROL OF DISABILITY IN MILITARY POPULATIONS.
CONTEMPORARY EPIDEMIOLOGIC METHODS ARE APPLIED TO CAUSES OF DISABILITY IN MILITARY POPULATIONS. MULTIDISCIPLINARY COLLABORATIVE APPROACHES ARE UTILIZED AND NEW METHODS DEVELOPED AS REQUIRED.
SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research funds n.a.

3.0158,
MECHANISMS OF TRANSMISSION OF HEPATITIS VIRUSES
W.H. Bancroft, U.S. Dept. of Defense, Army, Medical Research & Development Command, Communicable Disease & Immunology Research Div., *Washington, District of Columbia* 20012 (DA0B6513)
TO DEFINE THE EPIDEMIOLOGY OF HEPATITIS IN MILITARY POPULATIONS IN ORDER TO ESTABLISH METHODS FOR REDUCING DISABILITY FROM HEPATITIS. EMPHASIS IS ON DEVELOPING AND APPLYING SENSITIVE AND SPECIFIC METHODS FOR DETECTION OF HEPATITIS VIRUSES/ ANTIGENS AND ANTIBODIES TO DETERMINE HOST FACTORS IMPORTANT IN RESISTANCE TO DISEASE AND INFECTION IM MILITARY PERSONNEL.
NEW METHODS FOR IDENTIFICATION AND ANTIGENIC ANALYSIS OF HEPATITIS VIRUSES ARE UNDER DEVELOPMENT. THE IMMUNE RESPONSE OF PATIENTS INFECTED WITH HEPATITIS VIRUSES IS STUDIED TO DEFINE SENSITIVE PARAMETERS OF INFECTION AND TO DEFINE FACTORS CRITICAL IN IMMUNITY. THE EPIDEMIOLOGY OF HEPATITIS B IN MILITARY POPULATIONS IS DEFINED.
SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research funds n.a.

3.0159,
ANTI-SCHISTOSOMAL DRUG DEVELOPMENT AND MALARIA IMMUNOLOGY AND VECTOR STUDIES
W.A. Reid, U.S. Dept. of Defense, Army, Medical Research & Development Command, Medical Research Unit, *APO, New York, New York* 09676 (DA0B6525)
FIND NEW PROPHYLACTIC AND CURATIVE DRUGS FOR THE PREVENTION AND CURE OF SCHISTOSOMIASIS INFECTIONS AND TO STUDY THE CLINICAL, EPIDEMIOLOGIC, DRUG SUSCEPTIBILITY AND VECTOR TRANSMISSION PATTERNS OF FALCIPARUM MALARIA IN THE AMAZON RIVER BASIN OF BRAZIL. BOTH ARE PRIMARY DISEASES WHICH WOULD BE ACQUIRED BY U.S. MILITARY AND DOD CIVILIAN PERSONNEL IN THE EVENT OF DEPLOYMENT TO ANY OF NUMEROUS TROPICAL AREAS OF THE WORLD.
THE WRAIR ANTI-SCHISTOSOMAL DRUG TESTING PROGRAM CONTINUES TO SUBMIT CANDIDATE COMPOUNDS FOR PROPHYLACTIC (PMT) AND CURATIVE (PCT) TESTING AGAINST SCHISTOSOMIASIS IN MICE. COMPOUNDS ACTIVE IN THE PRIMARY SCREEN ARE EXTENSIVELY REEXAMINED FOR CONFIRMATION AND DOSE RESPONSE PATTERNS. THE MALARIA IMMUNOLOGY STUDIES INCLUDE THE TESTING OF SERA FROM ENDEMIC AREAS BY THE INDIRECT FLUORESCENT ANTIBODY TEST, IN VITRO DRUG SUSCEPTIBILITY TESTING AND CREATION OF A CRYOBANK OF HUMAN STRAINS OF PLASMODIUM FALCIPARUM. MALARIA VECTOR TRANSMISSION STUDIES INCLUDE FIELD AND LABORATORY ANALYSIS OF MORPHOLOGICAL, BEHAVIORAL, PHYSIOLOGICAL AND DDT SUSCEPTIBILITY PATTERNS OF ANOPHELES DARLINGI AND OTHER POTENTIAL ANOPHELENE MALARIA VECTORS.

3.0160,
FIELD STUDIES OF RICKETTSIOSES AND OTHER TROPICAL DISEASES
M.G. Groves, U.S. Dept. of Defense, Army, Medical Research & Development Command, Medical Research Unit, *Kuala Lumpur* (DA0B6526)
1. INVESTIGATE THE EPIDEMIOLOGY OF SCRUB TYPHUS IN HUMAN POPULATIONS; 2. STUDY THE CHIGGER VECTOR OF SCRUB TYPHUS; 3. DETERMINE THE STRAINS OF R. TSUTSUGAMUSHI CAUSING HUMAN INFECTIONS; 4. EVALUATE NEW TREATMENTS FOR SCRUB TYPHUS; 5. STUDY THE BASIS OF SCRUB TYPHUS IMMUNITY; 6. DEVELOP A LABORATORY ANIMAL MODEL FOR SCRUB TYPHUS. THESE STUDIES ARE DESIGNED TO ELIMINATE SCRUB TYPHUS AS A MILITARY MEDICAL PROBLEM.
1. EVALUATION OF CLINICAL, PATHOLOGICAL, AND SEROLOGICAL CHARACTERISTICS OF SCRUB TYPHUS IN RURAL POPULATIONS. 2. DETERMINE CHANGES IN CHIGGER POPULATIONS DUE TO CHANGES IN ECOLOGY. IDENTIFY R. TSUTSUGAMUSHI INFECTION IN VECTOR CHIGGERS. 3. ANTIGENICALLY CHARACTERIZE R. TSUTSUGAMUSHI STRAINS ISOLATED THROUGHOUT THE ENDEMIC REGION. 4. ADMINISTER SINGLE DOSE DOXYCYCLINE IN EARLY FEBRILE DISEASE. 5. TEST ANTIGEN-STIMULATED, IMMUNE LYMPHOCYTES FOR BLASTOGENESIS. 6. CHARACTERIZE R. TSUTSUGAMUSHI INFECTION IN CYNOMOLGUS MONKEYS.
SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research funds n.a.

3.0161,
MILITARY PSYCHIATRY EPIDEMIOLOGY
D.H. Marlowe, U.S. Dept. of Defense, Army, Medical Research & Development Command, Neuropsychiatry Div., *Washington, District of Columbia* 20012 (DA0C6454)
THIS UNIT EXAMINES MILITARY ORGANIZATIONAL, SOCIAL PSYCHOLOGICAL, AND ENVIRONMENTAL FACTORS THAT CREATE RISK FOR AND CONDUCE TO PSYCHIATRIC DISEASE, PSYCHOSOMATIC ILLNESS, BEHAVIORAL DYSFUNCTION AND PHYSICAL ILLNESS AS THEY EFFECT ARMY PERSONNEL AND IMPACT ON CARE GIVING AGENCIES.
THE METHODS OF EPIDEMIOLOGY, INCLUDING RECORDS SURVEILLANCE, POPULATION AND DEMOGRAPHIC ANALYSIS, QUESTIONNAIRE AND FIELD AND COHORT STUDIES AS WELL AS METHODS OF THE PSYCHOLOGICAL AND SOCIAL SCIENCES ARE USED TO DELINEATE ENVIRONMENTS OF RISK FOR PSYCHIATRIC ILLNESS AND PERIODS OF SPECIAL RISK FOR SUCH ILLNESSES AT CRITICAL POINTS IN THE CAREER OF THE SOLDIER.
SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research funds n.a.

3.0162,
TROPICAL AND SUBTROPICAL DISEASE IN MILITARY MEDICINE
H.E. Segal, U.S. Dept. of Defense, Army, Medical Research & Development Command, Medical Component, *Bangkok* (DA0C6465)
TO DEFINE THE ECOLOGICAL AND BIOLOGICAL FACTORS THAT PREDISPOSE U.S. MILITARY PERSONNEL TO TROPICAL INFECTIOUS DISEASES. CHARACTERIZATION OF DISEASE ORGANISMS AND RESPONSE TO INFECTIONS IS DONE IN SUPPORT OF VACCINE DEVELOPMENT.
THE ETIOLOGY, EPIDEMIOLOGY, AND ECOLOGY OF DISEASE ORGANISMS ARE STUDIED IN THE FIELD AND IN HOSPITAL. IN VITRO CULTIVATION, SEROLOGICAL PROCEDURES, MICROBIOLOGICAL ASSAYS, MOSQUITO INOCULATION, VECTOR COLONIZATION, AND OTHER TECHNIQUES ARE USED TO CHARACTERIZE DISEASE ORGANISMS.
SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research funds n.a.

3.0163,
MEDICAL FACTORS LIMITING SOLDIER EFFECTIVENESS
L. Ingraham, U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research, *Washington, District of Columbia* 20012 (DA0C6470)
TO IDENTIFY FACTORS IN THE MILITARY ORGANIZATIONAL, SOCIAL, PSYCHOLOGICAL AND PHYSICAL ENVIRONMENT THAT CREATE RISK FOR AND CONDUCE TO PSYCHIATRIC BREAKDOWN, BEHAVIORAL DYSFUNCTION, PSYCHOSOMATIC AND PHYSICAL ILLNESS AS THEY IMPACT ON INDIVIDUAL AND UNIT EFFECTIVENESS AND CONSUME HEALTH CARE RESOURCES.
THE METHODS OF EPIDEMIOLOGY, INCLUDING RECORDS ANALYSIS, POPULATION AND DEMOGRAPHIC ANALYSIS, QUESTIONNAIRE AND FIELD AND COHORT STUDIES AS WELL AS OBSERVATIONAL METHODS ARE EMPLOYED TO DEVELOP REQUISITE DATA.
SUPPORTED BY U.S. Dept. of Defense, Army, Medical Research & Development Command, Walter Reed Army Inst. of Research funds n.a.

3.0164,
STUDIES IN THE EPIDEMIOLOGY OF ARBOVIRAL INFECTIONS
G.T. Crane, U.S. Dept. of Defense, Army, Test & Evaluation Command, Environmental & Life Science Div., *Dugway Proving Ground, Dugway, Utah* 84022 (DA0K1535)
THE OBJECTIVE IS TO STUDY THE NATURAL INFECTION CHAIN FOR ARBOVIRUSES OF WESTERN UTAH.
ONE OF THE MAJOR PROBLEMS IN ARBOVIROLOGY IS AN UNDERSTANDING OF HOW EACH VIRUS IS MAINTAINED IN NATURE. SINCE CALIFORNIA ENCEPHALITIS IS ENDEMIC IN THE WESTERN UTAH AREA, DPG IS IN A UNIQUE POSITION TO STUDY THE VIRUS. JOINT EFFORTS OF DPG WITH SUCH AGENCIES AS THE CENTER FOR DISEASE CONTROL (CDC), THE UTAH STATE DEPARTMENT OF AGRICULTURE AND OF HEALTH HAVE RESULTED IN OBTAINING PARTIAL ANSWERS TO SOME OF THE BASIC EPIDEMIOLOGICAL AND EPIZOOTIOLOGICAL QUESTIONS. THIS STUDY IS DESIGNED TO HELP ELUCIDATE HOW THE VIRUS IS MAINTAINED IN NATURE.
SUPPORTED BY U.S. Dept. of Defense, Army, Test & Evaluation Command funds n.a.

3.0165,
EMISSION OF REO VIRUS AS AN INDICATOR OF PATHOGENIC VIRUSES
J.C. Spendlove, U.S. Dept. of Defense, Army, Test & Evaluation Command, Environmental & Life Science Div., *Dugway Proving Ground, Dugway, Utah* 84022 (DA0M1492)
TO CHARACTERIZE EMISSION OF REO VIRUS IN AEROSOLS FROM VARIOUS PROCESSES THAT INVOLVE WATER CONTAMINATED WITH HUMAN WASTE AND TO EVALUATE IT AS AN INDICATOR ORGANISM FOR HUMAN ENTEROVIRUS CONTAMINATION.
THIS PROJECT IS A CONTINUATION OF PREVIOUS STUDIES INVOLVING EMISSION OF MICROBIAL AEROSOLS FROM VARIOUS OPEN AIR SOURCES. THE PROJECT WILL BE CONDUCTED IN COOPERATION WITH THE UTAH STATE UNIVERSITY, DEPARTMENT OF MICROBIOLOGY. A DOCTORAL CANDIDATE FROM THE UNIVERSITY (MR. JACK ADAMS) WILL BE TRAINED AT DUGWAY PROVING GROUND IN THE USE OF BIOLOGICAL AIR SAMPLERS AND OTHER AEROBIOLOGICAL EQUIPMENT. THE STUDY WILL CONSIST OF AN EXAMINATION OF THE AEROSOL STABILITY CHARACTERISTICS OF THE VIRUS FOLLOWED BY AN EXAMINATION OF VARIOUS WASTE WATERS FOR CONCENTRATION OF REO VIRUS. THESE WILL INCLUDE WATER FROM SEWAGE TREATMENT PLANTS, COOLING TOWERS THAT UTILIZE WASTE WATER AND WASTE WATER USED IN SPRINKLER IRRIGATION OF AGRICULTURAL LAND. WATER SOURCES SHOWING SUFFICIENTLY HIGH CONCENTRATION WILL BE CHARACTERIZED FOR AEROSOL EMISSION OF REO VIRUS. EFFECTS OF METEOROLOGICAL CONDITIONS ON EMISSION OF VIRUS AND DOWNWIND CONCENTRATIONS AS CALCULATED BY USE OF ESTABLISHED DIFFUSION MODELS WILL BE EXAMINED. COMPARISON OF WATER CONCENTRATIONS OF REO VIRUS TO VARIOUS ENTEROVIRAL PATHOGENS WILL BE MADE ON THE BASIS OF THESE DATA. REO VIRUS WILL BE EVALUATED AS AN INDICATOR OF PATHOGENIC VIRUSES IN BOTH WATER AND AEROSOL EMISSION.
SUPPORTED BY U.S. Dept. of Defense, Army, Test & Evaluation Command funds n.a.

3.0166,
EPIDEMIOLOGY OF ROTAVIRUSES IN THE HUMAN POPULATION AT DUGWAY, UT (DA0M1512)
D.J. Adams, U.S. Dept. of Defense, Army, Test & Evaluation Command, Environmental & Life Science Div., *Dugway Proving Ground, Dugway, Utah* 84022 (DA0G5433)
TO INVESTIGATE THE EPIDEMIOLOGY OF VIRAL DIARRHEA IN AN ISOLATED ARMY INSTALLATION AT DUGWAY, UTAH.
WEEKLY SAMPLES OF SEWAGE WILL BE COLLECTED OVER A PERIOD OF MONTHS. ONE-HALF OF EACH SAMPLE WILL BE EXAMINED AT DPG FOR REOVIRUSES AND ROTAVIRUSES WITH THE CONCENTRATION AND ASSAY PROCEDURES DEVELOPED RECENTLY (IN PRESS). THE REMAINING SAMPLE WILL BE SENT TO THE MICROBIOLOGY DEPT, UTAH STATE UNIVERSITY, LOGAN, WHERE A GRATUITOUS EXAMINATION FOR PRESENCE OF ECHO, COXSACKIE AND POLIO VIRUS WILL BE PERFORMED. THE USA HEALTH CLINIC, DPG, WILL COOPERATE BY SUPPLYING STOOL SPECIMENS OF INFANT DIARRHEA FOR SIMILAR EXAMINATION AND ENTEROBACTERIAL STUDY.
SUPPORTED BY U.S. Dept. of Defense, Army, Test & Evaluation Command funds n.a.

3.0167,
STATISTICAL SURVEY OF MILITARY MORBIDITY DATA
R.A. Hodder, U.S. Dept. of Defense, Uniformed Services University of the Health Sciences, Dept. of Preventive Medicine & Biometrics, *Bethesda, Maryland* 20014 (DD700007)
TO ANALYZE EXISTING MILITARY MORBIDITY DATA IN ORDER TO IDENTIFY UNUSUAL DISEASE RATES AND SUBPOPULATIONS MOST AT RISK, AND TO COMPARE SUCH STATISTICS AMONG THE UNIFORMED SERVICES.
EXISTING DATA BASES FOR MILITARY MORBIDITY STATISTICS ARE IDENTIFIED. SELECTED SUMMARIES FROM THESE BASES ARE ANALYZED TO DETECT TRENDS, AND/OR UNUSUAL PATTERNS. GROUPS CONSIDERED AT HIGH RISK, PARTICULARLY IF OCCUPATIONALLY-RELATED, ARE STUDIED IN DETAIL TO DETERMINE RESPONSIBLE FACTORS.
SUPPORTED BY U.S. Dept. of Defense, Defense Advanced Research Projects Agency funds n.a.

3.0168,
IMMUNE SUPPRESSION IN BACTERIAL MENINGITIDES OF MILITARY IMPORTANCE IN THE MIDDLE EAST
R. Cahill, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, *FPO, New York, New York* 09527 (DN977579)
BACTERIAL MENINGITIDES CAN BE EPIDEMIC AND AS A GROUP POSSESS MISSION ABORTING POTENTIAL. IMMUNE SUPPRESSION IS A FEATURE OF THESE DISEASES. IDENTIFICATION OF THESE IMMUNE MECHANISMS INVOLVED MAY HAVE POTENTIAL IMPORTANCE IN PREVENTING THE DISEASE BEFORE OR PROVIDING ADJUNCTIVE THERAPY TO ANTIMICROBIAL DRUGS AFTER INFECTION.
PURULENT BACTERIAL AND TURBERCULOUS MENINGITIS PATIENTS WILL BE THOROUGHLY EVALUATED IMMUNOLOGICALLY. LYMPHOCYTES AND THEIR SUBPOPULATIONS ISOLATED BY NOVEL APPROACHES WILL BE TESTED FOR IN VITRO T LYMPHOCYTE COMPETENCE BY MICROCULTURE BLASTOGENESIS ASSAYS. THE SPECIFIC SUPPRESSION DUE TO EITHER SERUM FACTORS OR SUPPRESSOR CELLS WILL BE IDENTIFIED AND CHARACTERIZED. DELAYED SKIN TESTS WITH MICROBIAL RECALL ANTIGENS WILL BE DONE FOR TESTING IN VIVO T CELL COMPETENCE.
SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command funds n.a.

3.0169,
EXTENSION AND APPLICATION OF A SHIPBOARD MORBIDITY FORECAST MODEL
A.P. Jones, U.S. Dept. of Defense, Navy, Naval Health Research Center, Environmental & Social Medicine Div., *San Diego, California* 92152 (DN077660)
THE OPERATIONAL READINESS OF A NAVY SHIP DEPENDS TO A LARGE EXTENT UPON THE PHYSICAL AND MENTAL FITNESS OF THE CREW. A MORBIDITY FORECAST MODEL HAS BEEN DEVELOPED TO PREDICT FLEET UNITS, CREW ELEMENTS, AND OPERATIONAL CONDITIONS AT GREATEST RISK OF ELEVATED MORBIDITY AND IMPAIRED EFFECTIVENESS DURING DEPLOYMENT. THE PURPOSE OF THE PRESENT STUDY IS TO EXTEND THE SCOPE AND PRECISION OF THE MORBIDITY FORECAST MODEL AND TO INCREASE UNDERSTANDING OF THE CAUSAL MECHANISMS INVOLVED IN THE ETIOLOGY OF ILLNESS AND INJURY ABOARD SHIP. SUCH KNOWLEDGE WILL IDENTIFY POINTS IN THE CAUSAL CHAIN WHERE INTERVENTIONS AND PREVENTIVE ACTIONS MAY BE EFFECTIVELY APPLIED.
PREVIOUS STUDIES ABOARD DEPLOYED COMBAT SHIPS HAVE IDENTIFIED ENVIRONMENTAL, WORK CLIMATE, AND PERSONNEL COMPOSITION FACTORS THAT CAN BE USED TO PREDICT VARIATIONS IN SHIPBOARD ILLNESS AND ACCIDENT RATES. THE PRESENT STUDY WILL DETERMINE THE CONTRIBUTIONS OF ADDITIONAL VARIABLES, SUCH AS SHIP TYPE AND EXPERT OBSERVERS' REPORTS, TO MORBIDITY PREDICTIONS AND WILL EXAMINE THE PROCESSES BY WHICH ENVIRONMENTAL FACTORS RESULT IN DISEASE SYMPTOMS AND ACCIDENTS. THE FIRST PHASE OF THE STUDY WILL FOCUS ON EXTENDING THE MODEL BY TESTING NEW PREDICTOR VARIABLES USING SHIPS' OPERATIONAL DATA, CREW MEMBERS' QUESTIONNAIRE DATA, AND KEY INFORMANTS' REPORTS. THE SECOND PHASE WILL USE STATISTICAL CAUSAL MODELS TO DERIVE ETIOLOGICAL MECHANISMS AND PATHWAYS. LATER PHASES OF THE RESEARCH (PERFORMED IN OUT-YEAR FUNDING PERIODS) WILL SEEK TO DEVISE SPECIFIC INTERVENTION STRATEGIES AND APPLICATIONS CONSISTENT WITH KNOWLEDGE OF CAUSAL PATHWAYS ESTABLISHED EARLIER.
SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command funds n.a.

3.0170,
MORBIDITY FORECAST MODEL FOR COLD WEATHER OPERATIONS
L.M. Dean, U.S. Dept. of Defense, Navy, Naval Submarine Medical Research Lab., Personnel Psychology Dept., *Naval Submarine Base, Groton, Connecticut* 06340 (DN077671)
THE OPERATIONAL EFFECTIVENESS OF NAVY AND MARINE CORPS PERSONNEL IN COLD ENVIRONMENTS DEPENDS UPON THE PHYSICAL AND MENTAL FITNESS OF THE TROOPS, THE OPERATIONAL OBJECTIVES, AND OTHER SITUATIONAL AND ENVIRONMENTAL FACTORS. IN ORDER TO PLAN COLD WEATHER OPERATIONS, IT IS IMPORTANT TO IDENTIFY THE PERSONNEL AND SITUATIONAL FACTORS THAT INCREASE THE RISK OF MORBIDITY OR IMPAIRED EFFECTIVENESS AND TO DEVELOP A MODEL FOR PREDICTING ILLNESS AND COLD INJURY AND THE ASSOCIATED COSTS IN MAN-DAYS LOST. A DATA BASE AND DATA ANALYSIS CAPABILITY TO ENABLE QUANTITATIVE PREDICTION OF NON-EFFECTIVE DAY LOSSES DUE TO COLD ASSOCIATED MORBIDITY OR ILLNESS OCCURRING DURING NAVY AND MARINE CORPS OPERATIONS WILL BE ONE END PRODUCT OF THIS RESEARCH. ANOTHER OUTCOME WILL BE THE CAPABILITY OF MAKING RECOMMENDATIONS AS TO THOSE PERSONNEL MANAGEMENT PROCEDURES WHICH, IF APPLIED, MAY ENHANCE THE OVERALL EFFECTIVENESS OF THE COLD WEATHER COMBAT OPERATION.
THE FEASIBILITY OF USING AFTER-ACTION MEDICAL REPORTS FROM PREVIOUS NAVY AND MARINE CORPS COLD WEATHER EXERCISES AS A DATA BASE FROM WHICH MORBIDITY WILL BE EVALUATED. ADDITIONAL SOURCES OF SIMILAR DATA BASES WILL BE IDENTIFIED AND APPRAISED WITH RESPECT TO THEIR POTENTIALITY FOR QUANTITATIVE PREDICTION OF COLD WEATHER INJURIES AND ILLNESSES. IF SUCH DATA BASES CAN BE ESTABLISHED THEN PRELIMINARY ANALYSES WILL BE CONDUCTED ON THESE DATA IN ORDER TO IDENTIFY THE SALIENT PREDICTORS/VARIABLES ASSOCIATED WITH NON-EFFECTIVE DAY LOSSES DUE TO COLD INJURY IN COLD WEATHER NAVY AND MARINE CORPS OPERATIONS.
SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command funds n.a.

3.0171,
MONITORING THE ORAL HEALTH STATUS OF NAVAL PERSONNEL
J.C. Cecil, U.S. Dept. of Defense, Navy, Naval Dental Research Inst., Dental Care Delivery Div., *Great Lakes, Illinois* 60088 (DN077687)
THE PREVALENCE OF ORAL DISEASE AMONG NAVAL RECRUITS IS NEARLY UNIVERSAL. THERE IS LITTLE DATA AVAILABLE ON THE ORAL HEALTH STATUS OF NONRECRUITS IN THE NAVY. THE OBJECTIVE OF THIS STUDY IS TO COLLECT AND ANALYZE ORAL EPIDEMIOLOGIC DATA USEFUL IN DETERMINING THE PREVALENCE, INCIDENCE, SEVERITY OF DENTAL DISEASE, AND NEED FOR TREATMENT AMONG NAVAL PERSONNEL.
DENTAL EXAMINATIONS WILL BE PERFORMED AND SALIVA SAMPLES WILL BE COLLECTED FROM MILITARY PERSONNEL. VALIDATED ORAL EPIDEMIOLOGIC INDICES WILL BE USED WITH RETROSPECTIVE, CROSS-SECTIONAL, AND LONGITUDINAL CLINICAL DATA FOR ANALYSIS. DEMOGRAPHIC, DENTAL AND MEDICAL HISTORY, AND PERSONNEL PERFORMANCE DATA WILL BE GATHERED FROM EXISTING DATA BASES OF THE NAVY. AGGREGATE DATA OBTAINED WILL BE ANALYZED USING AUTOMATED DATA PROCESSING AND STATISTICAL METHODS. ORAL HEALTH STATUS PROFILES OF SUBGROUPS OF THE NAVAL POPULATION WILL BE USED TO EVALUATE THERAPEUTIC AND PREVENTIVE DENTAL PROGRAMS, AND TO PREDICT THOSE MOST AT RISK FOR INCREASED DENTAL DISEASE.
SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command funds n.a.

3.0172,

DISTRIBUTION AND PREVALENCE OF MALARIA IN THE PHILIPPINES ESPECIALLY CHLOROQUINE-RESISTANT STRAINS OF PLASMODIUM FALCIPARUM

K. Sorensen, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, *APO, San Francisco, California* 96528 (DN077691)

THE OBJECTIVE OF THIS STUDY IS TO DETERMINE THE DISTRIBUTION OF MALARIA IN THE PHILIPPINES AND THE PREVALENCE OF THE DISEASE IN THE INDIGENOUS POPULATIONS. CHLOROQUINE-RESISTANCE FALCIPARUM MALARIA HAS BEEN REPORTED BUT AREAS OF RISK ESPECIALLY FOR U.S. MILITARY PERSONNEL STATIONED IN THE PHILIPPINES ARE NOT COMPLETELY DOCUMENTED.

CASES OF SUSPECTED MALARIA SEEN AT SAN LAZARO HOSPITAL MANILA WILL BE CONFIRMED BY LABORATORY EXAMINATION OF BLOOD SMEARS. PATIENTS WILL BE TREATED BY THE HOSPITAL STAFF WITH CHLOROQUINE AND FOLLOWED IN THE EVENT OF RELAPSE. TREATMENT FAILURES WILL BE TREATED BY STAFF PHYSICIANS WITH OTHER EFFECTIVE ANTI-MALARIAL DRUGS. AREAS YIELDING HIGH NUMBERS OF CASES OF MALARIA WILL BE SURVEYED BY STANDARD MALARIOMETRIC METHODS AND THE PREVALENCE OF DISEASE AND INFECTION RATES ESTABLISHED. SEROLOGIC METHODS WILL ALSO BE USED TO SUPPORT EPIDEMOLOGIC INVESTIGATIONS.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command funds n.a.

3.0173,

EVALUATION OF HEALTH RISKS FOR NAVY OCCUPATIONS

R.F. Booth, U.S. Dept. of Defense, Navy, Naval Health Research Center, Environmental & Social Medicine Div., *San Diego, California* 92152 (DN077698)

THE PURPOSE OF THIS WORK UNIT IS TO EVALUATE THE NEED FOR REVISED HEALTH AND SAFETY STANDARDS IN SELECTED NAVY OCCUPATIONAL SPECIALTIES. WIDE DIFFERENCES IN HOSPITALIZATION RATES ACROSS NAVY OCCUPATIONAL GROUPS INDICATE A NEED TO EVALUATE HEALTH RISKS IN VARIOUS NAVAL OCCUPATIONS AND TO MODIFY PHYSICAL AND MENTAL FITNESS CRITERIA WHERE BIOMEDICAL RISKS ARE QUITE HIGH. HIGH LEVELS OF OCCUPATIONAL MORBIDITY MAY COMPROMISE OPERATIONAL READINESS AND EFFICIENCY OF NAVAL UNITS AND ADD TO OPERATIONAL COSTS. QUESTIONS TO BE ADDRESSED INCLUDE: WHAT ARE THE RISKS OF DISEASE, DISABILITY, AND MORTALITY IN SPECIFIC NAVAL OCCUPATIONS AND WORK ENVIRONMENTS. WHAT ARE THE DEMOGRAPHIC, ORGANIZATIONAL, ENVIRONMENTAL, AND TASK-RELATED FACTORS THAT EXPLAIN DIFFERENCES IN MORBIDITY AND MORTALITY. THE FEASIBILITY OF ALTERNATIVE STRATEGIES FOR REDUCING OCCUPATION-RELATED HEALTH RISKS WILL BE EVALUATED IN TERMS OF MANPOWER CONSTRAINTS AND MEDICAL SCREENING CAPABILITIES.

COMPUTERIZED MEDICAL RECORDS AND SERVICE HISTORY DATA FOR ALL NAVY ENLISTEES HOSPITALIZED DURING 1966-1977 WILL BE ANALYZED. PERSONNEL CHARACTERISTICS AND MORBIDITY/MORTALITY DATA WILL BE COMPARED FOR MAJOR ENLISTED OCCUPATIONAL GROUPS ON A CROSS-SECTIONAL BASIS IN TERMS OF ANNUAL INCIDENCE RATES. LONGITUDINAL STUDIES WILL BE CONDUCTED ON SELECTED HIGH RISK OCCUPATIONS TO RELATE LONG-TERM HEALTH HISTORIES TO JOB RESPONSIBILITIES AND WORK EXPERIENCES. PRELIMINARY STUDIES HAVE INDICATED THAT HOSPITAL CORPSMEN, ENGINEERING RATES, AND CONSTRUCTION PERSONNEL ARE AT HIGHER RISK FOR ILLNESS OR INJURY THAN OTHER OCCUPATIONAL SPECIALTIES. NAVAL OCCUPATIONAL TASK ANALYSIS PROGRAM SURVEY RESULTS AND SITE VISITS TO NAVAL FACILITIES WILL BE UTILIZED TO MAKE DETAILED COMPARISONS OF JOB CHARACTERISTICS, TASK DEMANDS, WORK ACTIVITIES, AND ENVIRONMENTAL CONDITIONS IN SELECTED HIGH AND LOW RISK OCCUPATIONS.

3.0174,

A BIOCHEMICAL STUDY OF CARDIOVASCULAR AND OTHER DISEASE RISK FACTORS ASSOCIATED WITH SUBMARINE SERVICE CAREERS

D.V. Tappan, U.S. Dept. of Defense, Navy, Naval Submarine Medical Research Lab., Biochemistry Div., *Naval Submarine Base, Groton, Connecticut* 06340 (DN977597)

TO EVALUATE BY BIOCHEMICAL AND PHYSIOLOGIC MEASURES THE EFFECTS OF LONG-TERM SUBMARINE DUTY ON THE APPEARANCE OF ANTECEDENTS OF DEGENERATIVE DISEASES, ESPECIALLY THOSE OF THE CARDIOVASCULAR SYSTEM. INCREASED CHOLESTEROL LEVELS, CHANGES IN GLUCOSE TOLERANCE AND CARDIOVASCULAR DISEASE RISKS HAVE BEEN FOUND TO BE DIRECTLY RELATED TO SUBMARINE EXPERIENCE. THESE DATA MAKE ANALYSES OF CARDIOVASCULAR RISK FACTORS AND DIABETES SUSCEPTIBILITY OF MAJOR IMPORTANCE TO THE HEALTH OF THE SUBMARINEH POPULATION.

SELECTED BIOMEDICAL VARIABLES ARE BEING MEASURED ON RANDOMLY SELECTED GROUPS OF ACTIVE DUTY AND RETIRED SUBMARINERS AND MATHCHED GROUPS OF OTHER NAVAL PERSONNEL TO EVALUATE INDICATIONS OF INCREASES IN POTENTIAL ILLNESSES THAT MAY BE RELATED TO TIME SPENT ABOARD SUBMARINES. A GROUP OF RETIRED PERSONNEL AGED 45-55 YEARS, GROUPS OF ACTIVE DUTY SUBJECTS WITH 5-9 YEARS AND 16-20 YEARS OF SUBMARINE EXPERIENCE AND WITH APPROPRIATE NON-SUBMARINER CONTROLS ARE BEING STUDIED. CLINICAL CHEMISTRY, PHYSIOLOGIC, HEMATOLOGIC, AND PSYCHOSOCIAL VARIABLES RELATED TO THE DEVELOPMENT OF CARDIOVASCULAR AND ASSOCIATED DISEASES ARE BEING MEASURED.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command funds n.a.

3.0175,

DIAGNOSIS, EPIDEMIOLOGY AND TREATMENT OF HEPATITIS B VIRUS INFECTIONS IN SOUTHEAST ASIA

R.P. Beasley, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, Epidemiology & Clinical Investigation Dept., *APO Box 14, San Francisco, California* 96263 (DN041425)

THE MAJOR OBJECTIVES ARE TO: (1) DETERMINE THE MECHANISMS OF TRANSMISSION OF HEPATITIS B INFECTION; (2) IDENTIFY GROUPS SUITABLE FOR PROPHYLACTIC TRIALS; (3) UNDERSTAND THE FACTORS RELATING HBV INFECTIONS TO THE DEVELOPMENT OF CHRONIC LIVER DISEASE.

THE APPROACH OF THESE STUDIES IS EPIDEMIOLOGIC. THE PREVALENCE OF HEPATITIS B SURFACE ANTIGEN (HBSAG) AND HEPATITIS B SURFACE ANTIBODY (ANTI HBS) ARE STUDIED IN VARIOUS POPULATIONS TO DETERMINE WHAT DEMOGRAPHIC AND GEOGRAPHIC FACTORS ARE ASSOCIATED WITH INFECTION. CONVERSIONS OF ANTIGEN AND ANTIBODY STATUS ARE STUDIED IN VARIOUS POPULATIONS TO DETERMINE THE INCIDENCE OF NEW INFECTIONS AND IDENTIFY THE GROUPS AT HIGHEST RISK.

3.0176,

METHODS AND PROCEDURES FOR IMPROVED REPORTING OF OUTPATIENT MEDICAL DATA

A.P. Jones, U.S. Dept. of Defense, Navy, Naval Health Research Center, Environmental & Social Medicine Div., *San Diego, California* 92152 (DN877531)

HEALTH CARE PLANNERS AND MANAGERS NEED ACCURATE DATA ON WORKLOADS, TYPES OF CASUALTIES AND DISEASES TO BE TREATED, UTILIZATION OF MEDICAL PERSONNEL AND BIOMEDICAL RISKS IN THE WORK ENVIRONMENT IN ORDER TO PROVIDE TIMELY PREVENTIVE AND TREATMENT SERVICES. PRESENT OUTPATIENT RECORD SYSTEMS GENERALLY ARE INADEQUATE FOR SUCH PURPOSES. THE PURPOSE OF THIS STUDY IS TO DEVISE AND DETERMINE THE FEASIBILITY OF IMPROVED REPORTING PROCEDURES FOR NAVY SHIPS AND SHORE DISPENSARIES AND TO PROVIDE A BASIS FOR ASSESSING THE SEVERITY AND RISK OF ENVIRONMENTAL HEALTH HAZARDS AS WELL AS OFFERING THE POTENTIAL FOR BETTER MANAGEMENT OF MEDICAL RESOURCES. THE FINAL OBJECTIVE OF THIS WORK UNIT WILL BE TO DEPICT PERSONNEL AND EQUIPMENT REQUIREMENTS. TO DEVISE NECESSARY DATA FORMS, AND TO DEVELOP PROPOSALS FOR REVISION OF EXISTING BUMED DIRECTIVES IN ORDER TO IMPLEMENT COST EFFECTIVE IMPROVEMENTS IN THE EXISTING OUTPATIENT MORBIDITY REPORTING SYSTEM.

A SICK CALL CARD WAS DEVELOPED TO RECORD INDIVIDUAL ILLNESSES AND INJURIES ABOARD DEPLOYED NAVY SHIPS FOR RESEARCH PURPOSES. THIS REPORTING PROCEDURE HAS BEEN EXPANDED AND REVISED AND IS NOW AVAILABLE IN A MACHINE-SCORABLE FORM THAT PROVIDES ESSENTIAL DEMOGRAPHIC, OCCUPATIONAL, TREATMENT, AND DISPOSITION INFORMATION FOR EPIDEMIOLOGICAL ANALYSES AND RESEARCH. THIS FORM WILL BE FURTHER MODIFIED FOR EVALUATION AT SHORE-BASED OUTPATIENT FACILITIES. MONTHLY OUTPATIENT MORBIDITY REPORTS AND OTHER MEDICAL REPORTS WILL BE GENERATED ON AN EXPERIMENTAL BASIS.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command funds n.a.

3.0177,

THE EPIDEMIOLOGY AND POST-TREATMENT OUTCOMES OF TRAUMA IN NAVAL ENVIRONMENTS

R.F. Booth, U.S. Dept. of Defense, Navy, Naval Health Research Center, Environmental & Social Medicine Div., *San Diego, California* 92152 (DN977544)

ACCIDENTAL INJURIES ARE THE LEADING CAUSE OF HOSPITALIZATION AMONG NAVY ACTIVE DUTY PERSONNEL. THESE INJURIES MAKE A SUBSTANTIAL CONTRIBUTION TO MAN-DAYS LOST FROM THE JOB, DEMANDS FOE HEALTH CARE SERVICES, AND LONG-TERM DISABILITY AND MORTALITY FOR ACCIDENT VICTIMS. THE INTERACTION OF INDIVIDUAL, OCCUPATIONAL, AND ENVIRONMENTAL CHARACTERISTICS AS THEY RELATE TO THE INCIDENCE OF ACCIDENTAL INJURIES WILL BE INVESTIGATED. THE IMPLICATIONS OF AN INJURY-PRODUCING ACCIDENT FOR LENGTH OF HOSPITALIZATION, PROLONGED DISABILITY, PERFORMANCE EFFECTIVENESS, AND CAREER RETENTION OF ACCIDENT VICTIMS ALSO WILL BE INVESTIGATED. BY IDENTIFYNG THOSE POPULATIONS AND WORK SETTINGS WHERE THE RISKS OF TRAUMA ARE GREATEST, IT SHOULD BE POSSIBLE TO RECOMMEND MEANS FOR REDUCING THE NUMBER AND SEVERITY OF ACCIDENT CASUALTIES.

ANALYSES WILL BE CONDUCTED OF MEDICAL AND SERVICE HISTORY DATA FOR ALL NAVY ENLISTEES WHO WERE HOSPITALIZED FOR THE TREATMENT OF ACCIDENTAL INJURIES DURING 1965 THROUGH 1976. THE INCIDENCE OF TRAUMA-PRODUCING ACCIDENTS WILL BE RELATED TO THE VICTIM'S DEMOGRAPHIC AND MILITARY STATUS CHARACTERISTICS, OCCUPATION, JOB EXPERIENCE, AND WORK SETTING. DETAILED ANALYSES OF ORGANIZATIONAL AND ENVIRONMENTAL CIRCUMSTANCES SURROUNDING ACCIDENTAL INJURIES WILL BE POSSIBLE IF NAVAL SAFETY CENTER (NSC) RECORDS ARE USED IN CONJUNCTION WITH INPATIENT REORDS. A FOLLOW-UP STUDY WILL BE MADE OF INJURY VICTIMS TO DETERMINE HOW THE TYPE AND SEVERITY OF TRAUMA IS RELATED TO LENGTH OF HOSPITALIZATON, LONG-TERM DISABILITY, SUBSEQUENT PERFORMANCE EFFECTIVENESS, AND CAREER RETENTION.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command, National Naval Medical Center funds n.a.

PARASITIC DISEASES OF THREAT TO MILITARY OPERATIONS IN THE MIDDLE EAST AND NEARBY AFRICAN STATES.

N.S. Mansour, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Immunology & Parasitology Dept., *FPO, New York, New York* 09527 (DN977622)

TO MAP THE DISTRIBUTION OF HUMAN PARASITES IN THE MIDDLE TEAST AND SOME AFRICAN STATES IN ORDER TO IDENTIFY THE AREAS OF RISK TO THE MILITARY, TO FURNISH

RELEVANT EPIDEMIOLOGICAL INFORMATION FOR FUTURE PLANNING OF DISEASE PREVENTION AND CONTROL, AND TO DEVELOP AND STANDARDIZE TECHNIQUES FOR FAST RELIABLE MEANS OF DIAGNOSIS AND DETECTION OF OBSCURE CONDITIONS.

PARASITOLOGICAL SURVEYS WILL BE CONDUCTED IN DIFFERENT AREAS OF NEARBY COUNTRIES. STOOL, URINE AND BLOOD SMEARS WILL BE COLLECTED AND EXAMINED UTILIZING STANDARD PARSITOLOGICAL METHODS. SERA WILL BE TESTED BY ESTABLISHED SEROLOGICAL TECHNIQUES TO DETERMINE PRESENT AND PAST EXPERIENCE WITH THE DIFERENT PARASITES OF IMPORTANCE. WHERE APPROPRIATE, INTERMEDIATE HOSTS, VECTORS AND RESERVOIRS HOSTS WILL BE COLLECTED IDENTIFIED AND EXAMINED. MAPS WILL BE PREPARED TO DEPICT THE DISTRIBUTION OF THE IMPORTANT PARASITES AND THEIR RELEVANT EPIDEMIOLOGIC DATA.

3.0179,

STUDIES OF THE VIRAL, CLINICAL, ENTOMOLOGICAL, ECOLOGICAL, AND EPIDEMIOLOGICAL ASPECTS OF EPIDEMIC RIFT VALLEY FEVER IN EGYPT

O.L. Wood, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Virology Dept., *FPO, New York, New York* 09527 (DN977452)

RIFT VALLEY FEVER (RVF) CLEARLY HAS MISSION-ABORTING POTENTIAL: AT LEAST 1/2 MILLION HUMAN CASES OCCURRED IN EGYPT 1977-1978, INCLUDING SOME WITH FATAL HEMORRHAGIC FEVER, BLINDNESS OR ENCEPHALITIS. ISOLATION OF RVF FROM DOMESTIC ANIMALS IN LATE 1979 SUGGESTS THAT THE DISEASE IS PERMANENTLY ESTABLISHED IN EGYPT. THE OBJECT OF THIS MULTIDISCIPLINARY STUDY IS TO DETERMINE FACTORS CONTROLLING THE CLINICAL SPECTRUM OF THE DISEASE, TO DEVELOP METHODS FOR RAPID DIAGNOSIS, AND TO IDENTIFY FACTORS INFLUENCING PERSISTENCE AND EPIDEMIC SPREAD OF THE VIRUS.

MULTI-DEPARTEMNTAL FIELD AND LABORATORY STUDIES WILL IDENTIFY RVF VECTORS AND RESERVOIRS. FLUORESCENT ANTIBODY (FA) TEST, ENZYME LINKED IMMUNO-SORBENT ASSAY (ELISA) AND GEL DIFFUSION WILL BE EVALUATED FOR RAPID DIAGNOSIS IN HUMANS AND ANIMALS. WE WILL ATTEMPT TO DEVELOP ANIMAL MODELS OF THE HUMAN CLINICAL SYNDROMES, IDENTIFY SPECIES SERVING AS RESERVOIRS, AND COMPARE VIRUS STRAIN VIRULENCE. SPECIES USED WILL INCLUDE: MUS MUSCULUS, MESOCRICETUS AURATUS, PSAMMOMYS OBESUS, ORYCTOLAGOUS CUNICULUS, CAMELUS DROMEDARIUS, BUBALUS BUBALUS AND OVIS ARIES.

ARBOVIRAL DISEASES IN INDONESIA: EPIDEMIOLOGY AND DISTRIBUTION

J.G. Olson, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, *Jakarta Det., APO, San Francisco, California* 96356 (DN877464)

TO IDENTIFY ARTHROPOD-BORNE VIRUSES IN INDONESIA WHICH ARE CAUSING INFECTION IN HUMANS AND ANIMALS AND TO DETERMINE THE RELATIVE IMPORTANCE AND DISTRIBUTION OF EACH AS A CAUSE OF ILLNESS IN MAN.

VIRUS ISOLATIONS WILL BE ATTEMPTED FROM HUMAN CLINICAL SPECIMENS, ANIMAL SERA AND POOLED ARTHROPEDS COLLECTED IN INDONESIA. SEROLOGIC EVIDENCE OF ARBOVIRAL INFECTION WILL BE SOUGHT FROM BOTH HUMAN AND ANIMAL SERA USING HEMAGGLUTINATION INHIBITION (HI) AND IMMUNE ADHERANCE HEMAGGLUTINATION (IAHA) TESTS FOR ANTIBODIES AGAINST VIRUSES KNOWN TO BE ACTIVE IN SOUTHEAST AISA AND THE WESTERN PACIFIC.

A LONGITUDINAL ASSESSMENT OF THE CAUSE OF MYOPIA IN SUBMARINERS

J.A. Kinney, U.S. Dept. of Defense, Navy, Naval Submarine Medical Research Lab., Vision Div., *Naval Submarine Base, Groton, Connecticut* 06340 (DN877504)

A NUMBER OF STUDIES OF THE VISION OF SUBMARINERS CONDUCTED OVER THE YEARS HAVE REVEALED A HIGH INCIDENCE OF MYOPIA (NEAR-SIGHTEDNESS) AND OTHER ASSOCIATED SYMPTOMS. CONFINEMENT WITHIN THE SUBMARINE, WITH ITS CONSTANT REQUIREMENTS FOR ACCOMMODATION AND CONVERGENCE, IS A POSSIBLE CAUSE OF THIS SYNDROME, BUT OTHER EXPLANATIONS CANNOT BE ELIMINATED ON THE BASIS OF AVAILABLE EVIDENCE. FOR EXAMPLE, DIFFERENCES IN THE LIFE-STYLE OF THE MEN, PARTICULARLY IN THEIR YOUNGER FORMATIVE YEARS, COULD ACCOUNT FOR REDUCED ACUITY WHEN COMPARED WITH OLDER MEN REARED UNDER OTHER SOCIAL CONDITIONS. THIS RESEARCH IS DESIGNED TO FIND THE BASIC CAUSE OF THE INCREASE IN MYOPIA; IF SUBMARINE LIVING SHOULD BE RESPONSIBLE, REMEDIAL PROCEDURES COULD BE DEVELOPED IN FUTURE WORK-UNITS.

THE RESEARCH DESIGN IS A LONGITUDINAL STUDY OF TWO GROUPS, ONE SUBMARINERS AND THE OTHER AN AGE-MATCHED GROUP OF NATIONAL GUARDSMEN. THE BASIC DATA FOR THE TWO GROUPS HAVE ALREADY BEEN OBTAINED, THREE YEARS AGO, IN ANOTHER WORK UNIT; TWO RETESTS, ONE IMMEDIATELY AND ONE IN THREE TO FOUR YEARS, WILL BE MADE ON THE AVAILABLE MEN, USING THE SAME TESTS AND METHODS AS THE BASIC DATA. A COMPARISON OF THE TEST-RETEST CHANGES IN THE TWO GROUPS, AS A FUNCTION OF AGE, SHOULD GIVE A CLEAR-CUT ANSWER AS TO WHETHER SUBMARINE LIVING IS RESPONSIBLE FOR THE VISUAL CHANGES.

3.0182,

ANTIBIOTIC RESISTANT NEISSERIA GONORRHOEAE: DETERMINATION OF PREVALENCE AND SPREAD IN INDONESIA

R.C. Rockhill, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, *Jakarta Det., APO, San Francisco, California* 96356 (DN877410)

TO DETERMINE THE PREVALENCE OF NEISSERIA GONORRHOEAE (N. GC.), ESPECIALLY PENICILLIN RESISTANT STRAINS IN SELECTED MAJOR SEA PORTS OF INDONESIA; DETERIME THE MINIMUM INHIBITORY CONCENTRATION OF SELECTED ANTIBIOTICS TO N. GC; AND DETERMINE THE PREVALENCE OF NON-CULTURABLE N. GC. IN BOTH SYMPTOMATIC AND ASYMPTOMATIC PATIENTS USING GENETIC TRANSFORMATION TO A COMPETENT N. GC. HOST.

SPECIMENS OBTAINED FROM PROMISCUOUS, SEXUALLY ACTIVE POPULATIONS WILL BE CULTURED FOR NEISSERIA SP. AND CHARACTERIZED BIOCHEMICALLY FOR N. GC. AND BETA LACTAMASE (PENICILLINASE) PRODUCTION. THE MINIMUM INHIBITORY CONCENTRATION (MIC) OF MAJOR USEFUL ANTIBIOTICS WILL BE ASSAYED BY THE AGAR DILUTION METHOD. SPECIMENS FROM WHCH NO N. GC. CAN BE CULTURED WILL BE TESTED FOR GENETIC TRANSFORMATION OF A NUTRITIONALLY DEFECTIVE COMPETENT HOST BY THE METHOD OF JANIK. ACQUISITION OF SPECIMENS WILL BE ACCOMPLISHED IN CONJUNCTION WITH THE INDONESIAN MINISTRY OF HEALTH, VENEREAL DISEASE CONTROL PROGRAM.

3.0183,

AMEBIASIS IN ASIA: DIAGNOSIS, EPIDEMIOLOGY AND IMMUNOLOGY OF ENTAMOEBA HISTOLYTICA

J.H. Cross, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, Medical Ecology Dept., *APO Box 14, San Francisco, California* 96263 (DN941411)

AMEBIASIS, INTESTINAL OR EXTRAINTESTINAL, CAN BE A DIAGNOSTIC PROBLEM IN MILITARY AS WELL AS CIVILIAN MEDICAL PRACTICE. THE OBJECTIVE OF THIS STUDY IS TO IMPROVE UPON THE CLASSICAL METHODS OF DETECTING INFECTIONS OF ENTAMOEBA HISTOLYTICA; TO OBTAIN INFORMATION ON THE PREVALENCE AND DISTRIBUTION OF THE PARASITE AND THE DISEASE BY STOOL AND SEROLOGIC EXAMINATIONS; AND TO STUDY THE ANTIGENICITY OF STRAINS OF THE PARASITE IN ORDER TO REFINE IMMUNOLOGIC METHODS OF DIAGNOSIS.

CONVENTIONAL METHODS AS WELL AS MODIFICATIONS OF THESE METHODS WILL BE USED TO DETECT E. HISTOLYTICA IN STOOL SPECIMENS, PROCTOSCOPIC PREPARATIONS AND BIOPSY MATERIAL. SEROLOGIC TESTING WILL BE DONE USING INDIRECT HEMAGGLUTINATION (IHA), GEL-DIFFUSION (G-D), ELISA TEST AND RADIO-IMMUNOASSAY (RIA). THE LATTER TWO WILL ALSO BE USED TO DETECT ANTIGENS IN SERA, ASPIRATES AND FECAL SPECIMENS. THE SEROEPIDEMIOLOGY OF AMEBIASIS WILL BE DONE BY EXAMINING STOOL SPECIMENS AND TESTING SERA FROM SAMPLED POPULATIONS IN THE PHILIPPINES.

3.0184,

EXPLORATION OF THE RELATIONS BETWEEN EYE COLOR, SELECTED PHYSIOLOGICAL MEASURES AND INDIVIDUAL SUSCEPTIBILITY

J.D. Bloom, U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command, National Naval Medical Center, *Bethesda, Maryland* 20014 (DN877532)

To explore the relations between eye color, selected physiological measures and individual noise susceptibility. Identification of any such relationships would have implications toward the prevention of noise-induced hearing loss among naval personnel working in potentially hazardous noise environments.

Examine the extensive audiometric data obtained from subjects in the thousand aviator study and subjects in the control group of the repatriated prisoner of war (RPW) study. From the records of those subjects exhibiting hearing levels of 50 dB or greater at 3000, 4000 or 6000 Hz (subject group I) and those subjects exhibiting hearing levels of 25 dB or less at 500 through 6000 Hz (subject group II), determine eye color, percent body fat, systolic and diastolic blood pressures (sitting and supine), serum uric acid, cholesterol, and triglycerides. Conduct appropriate statistical analyses to determine possible relations between individual noise susceptibility, eye color and the various physiological measures.

INFECTIOUS DISEASE RISKS TO TRANSLOCATED PERSONS IN INDONESIA

W.P. Carney, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, *Jakarta Det., APO, San Francisco, California* 96356 (DN141419)

TO IDENTIFY INFECTIOUS DISEASES IN OUTER ISLANDS OF INDONESIA OF RISK TO IMMIGRANTS WITH PRIOR DISEASE EXPOSURE UNLIKE THAT OF THE NEW ENVIRONMENT. THE STUDY HAS 3 PHASES: (1) BASELINE ASSESSMENT DISEASE AND DISEASE EXPOSURE OF INDIGENOUS AND PREVIOUSLY TRANSLOCATED PERSONS LIVING IN AREAS SELECTED FOR FUTURE TRANSSETTLEMENT (STRESSING INFECTIOUS DISEASE, THEIR ENVIRONMENTAL SOURCES, RESERVOIRS AND VECTORS); (2) ASSESSMENT OF DISEASE EXPERIENCE AMONG TRANSMIGRANT POPULATIONS PRIOR TO THEIR ARRIVAL IN TRANSSETTLEMENT AREA; (3) REASSESSMENT FOLLOWING IMMIGRATION.

FIELD TEAMS COLLECT FOR LABORATORY ANALYSIS BLOOD, SERUM AND STOOL SPECIMENS FROM SELECTED TRANSMIGRANT POPULATIONS PRIOR TO AND FOLLOWING EXPOSURE AT OUTER ISLAND SETTLEMENT SITES. FERAL AND DOMESTIC ANIMALS AND THEIR ECTOPARASITES ARE STUDIED FOR THEIR ROLE IN ZOONOTIC DISEASE. MOSQUITOES ARE COLLECTED FOR DETERMINING VECTORS OF MALARIA AND FILARIA AND EXAMINED FOR PATHOGENIC VIRUSES. INFORMATION RELEVANT TO THE ECOLOGY AND EPIDEMIOLOGY OF INFECTIOUS AND ENVIRONMENTAL DISEASES IS GATHERED.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research & Development Command, National Naval Medical Center funds n.a.

3.0186,

ARTHROPOD-VECTOR-DISEASE INTERRELATIONSHIPS

H. Hoogstraal, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Medical Zoology Dept., *FPO, New York, New York* 09527 (DN477104)

INVESTIGATE AND INCREASE KNOWLEDGE OF BLOODSUCKING ARTHROPODS (TICKS, MITES, FLEAS, LICE, MOSQUITOES, ETC.) KNOWN OR STRONGLY SUSPECTED TO HARBOR AND TRANSMIT VIRAL, RICKETTSIAL, AND PROTOZOAL AGENTS HAZARDOUS TO MAN. IDENTIFY HOSTS AND DEFINE LIFE CYCLES, DISTRIBUTION, AND EPIDEMIOLOGICALLY IMPORTANT FACTORS.

VERTEBRATES AND BLOODSUCKING ARTHROPODS ARE COLLECTED FOR PATHOGEN ISOLATION; LABORATORY COLONIES ARE USED FOR DISEASE TRANSMISSION STUDIES. ANIMALS USED ARE HAMSTER MESOCRICETUS AURATUS, RABBIT ORYCTOLAGUS CUNICULUS, AND PIGEON COLUMBA LIVIA.

3.0187,

IMMUNOLOGY OF HUMAN SCHISTOSOMIASIS; DISEASE OF MILITARY IMPORTANCE

G.I. Higashi, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Immunology & Parasitology Dept., *FPO, New York, New York* 09527 (DN477106)

SCHISTOSOMIASIS POSES AN EXTRAORDINARY THREAT TO MILITARY FORCES OPERATING IN ENDEMIC AREAS, BOTH IN IMMEDIATE MORBIDITY AND IN CHRONIC SERVICE-CONNECTED ILLNESS. PRESENT TREATMENT LACKS EFFECTIVENESS AND SAFETY. THE LONGTERM GOAL OF THIS STUDY IS THE DEVELOPMENT OF A PROTECTIVE VACCINE. THE IMMEDIATE GOAL IS TO DETERMINE IF NATURAL IMMUNITY DEVELOPS IN A POPULATION, THE MECHANISM OF THAT IMMUNITY, AND ITS ROLE IN THE EPIDEMIOLOGY OF THE DISEASE EGYPT, WITH APPROXIMATELY 20 MILLION CASES OF SCHISTOSOMIASIS IS AN IDEAL LOCATION FOR THIS STUDY. A LONGITUDINAL STUDY IS UNDERWAY IN A SAMPLE POPULATION OF 5-14 YEAR OLD SCHOOL BOYS, CHOSEN FOR THE KNOWN HIGH RATE AT WHICH THEY ACQUIRE INFECTION AND MANIFEST APPARENT IMMUNITY, IN A STABLE RURAL AREA HIGHLY ENDEMIC FOR SCHISTOSOMIASIS. CLINICAL STATUS, EGG EXCRETION AND CELLULAR AND HUMORAL IMMUNITY TO THE SCHISTOSOME ARE EVALUATED SEMI-ANNUALLY. AT THE SAME TIME ECOLOGICAL SURVEYS ARE CONDUCTED TO IDENTIFY AND QUANTITATE THE SNAIL VECTOR POPULATION. SELECTED SUBJECTS WILL BE HOSPITALIZED TO EVALUATE RENAL FUNCTION AND IMMUNOLOGIC COMPETENCE.

3.0188,

PATHOGENESIS AND HOST-PARASITE RELATIONS OF GEOGRAPHIC STRAINS OF SCHISTOSOMA JAPONICUM

J.H. Cross, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, Medical Ecology Dept., *APO Box 14, San Francisco, California* 96263 (DN877143)

TO DETERMINED DIFFERENCES IN HOST-PARASITE RELATIONS, PATHOGENESIS, SUSCEPTIBILITY, RESISTANCE, ENZYMATIC AND METABOLIC PATHWAYS AND ANTIGENICITY OF VARIOUS GEOGRAPHIC STRAINS OF SCHISTOSOMA JAPONICUM; AND TO ESTABLISH FACTORS RESPONSIBLE FOR THESE DIFFERENCES IN ORDER TO DEVELOP EFFECTIVE APPROACHES TO CONTROL THE DISEASE.

STRAINS OF S. JAPONICUM AND THEIR SNAIL HOSTS WILL BE ESTABLISHED IN THE LABORATORY AND HOST-PARASITE RELATIONS STUDIES DONE IN BOTH SNAIL AND MAMMALIAN HOSTS. SUSCEPTIBILITY AND RESISTANCE TO INFECTION WILL BE DETERMINED BY WORM DEVELOPMENT, EGG PRODUCTION AND PATHOGENESIS OF INFECTIONS. ANTIGENS FROM RESPECTIVE STRAINS WILL BE CHARACTERIZED, ENZYMATIC AND METABOLIC PATHWAYS DETERMINED BY ENZYME ASSAY. INFLUENCE OF SNAIL PASSAGE ON THE INFECTIVITY, PATHOGENESIS AND ACTIVITY OF CERTAIN ENZYME OF THE PARASITE IN THE DEFINITIVE HOST WILL BE ASCERTAINED.

3.0189,

HEALTH AND LONGEVITY IN RELATION TO LENGTH OF OCCUPATIONAL EXPOSURE TO THE NAVAL SUBMARINE ENVIRONMENT

W.L. Hunter, U.S. Dept. of Defense, Navy, Naval Submarine Medical Research Lab., Operational Medicine Dept., *Naval Submarine Base, Groton, Connecticut* 06340 (DN777382)

THE AIM OF THIS STUDY IS TO DETERMINE THE HEALTH EFFECTS OF PROLONGED OCCUPATIONAL EXPOSURE TO THE NUCLEAR POWERED SUBMARINE ENVIRONMENT. PARTICULAR ATTENTION WILL BE DIRECTED TOWARD OBTAINING INFORMATION REGARDING MORBIDITY/MORTALITY RELATED TO LOW-LEVEL RADIATION EXPOSURE RECEIVED IN THAT ENVIRONMENT. NEGATIVE FINDINGS WILL DOCUMENT THE SAFETY OF THE NUCLEAR-POWERED SUBMARINE FOR HUMAN HABITATION. POSITIVE FINDINGS ARE EXPECTED TO LEAD TO RECOMMENDATIONS SUCH AS: (A) FURTHER STUDIES TO DETERMINE ETIOLOGY OF DELETERIOUS HEALTH EFFECTS, (B) ASSESSMENT OF EXISTING ENVIRONMENTAL ENGINEERING SYSTEMS ABOARD SUBMARINES, AND (C) ALTERATIONS TO CURRENT PHYSICAL EXAMINATION REQUIREMENTS FOR CURRENT AND PAST SUBMARINE CREW MEMBERS.

THIS RECORD-LINKAGE PROJECT WILL COMPARE DISEASE PREVALENCE AND DISEASE-SPECIFIC MORTALITY RATES TO LENGTH OF SUBMARINE EXPERIENCE AND TO RADIATION EXPOSURE. THE PRINCIPAL DATA BASE WILL BE INFORMATION IN AUTOMATED DATA PROCESSING FILES MAINTAINED IN THE NAVY AND OTHER FEDERAL AGENCIES. IN ORDER TO DEVELOP A LARGE RISK BASE AMONG OLDER PERSONNEL, ATTENTION IS DIRECT TO RETIRED AND FLEET RESERVE PERSONNEL. THIS WORK UNIT WILL BE SUPPORTED BY A CONTRACT WITH YALE UNIVERSITY.

3.0190,

DISTRIBUTION OF PARASITIC DISEASES OF MILITARY IMPORTANCE IN THE PHILIPPINES

J.H. Cross, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, Medical Ecology Dept., *APO Box 14, San Francisco, California* 96263 (DN877409)

THE OBJECTIVE OF THIS STUDY WILL BE OBTAIN DATA ON THE DISTRIBUTION AND PREVALENCE OF PARASITIC DISEASES OF MILITARY IMPORTANCE THROUGHOUT THE PHILIPPINES THAT WILL AID IN THE IMPLEMENTATION OF EFFECTIVE MODELS FOR RISK PREDICTION AND PREVENTIVE PROGRAMS.

BIOMEDICAL SURVEYS WILL BE CONDUCTED THROUGHOUT PHILIPPINE ISLANDS FOCUSING ON THE DISTRIBUTION AND PREVALENCE OF BLOOD AND INTESTINAL PARASITIC DISEASES. STOOL SPECIMENS, BLOOD SMEARS AND SERA WILL BE COLLECTED AND EXAMINED BY APPROPRIATE PARSITOLOGICAL AND IMMUNOLOGICAL DIAGNOSTIC TECHNIQUES. ALL SURVEY DATA WILL BE COMPUTERIZED SO THAT CURRENT STATUS REPORTS ON PARASITIC DISEASES OF MILITARY IMPARTANCE CAN BE PRODUCED UPON DEMAND. INITIAL EMPHASIS WILL FOCUS ON THE SURVEILLANCE OF DISEASES.

3.0191,

EFFECTS OF OCCUPATIONAL EXPOSURE TO NONIONIZING RADIATION

A.F. Campbell, U.S. Dept. of Defense, Navy, Naval Aerospace Medical Research Lab., *Pensacola, Florida* 32512 (DN077700)

TO TEST THE HYPOTHESIS THAT REPEATED OCCUPATIONAL EXPOSURE TO NONIONIZING ELECTROMAGNETIC RADIATION (NEMR) HAS DELETERIOUS, PERHAPS DELAYED HEALTH EFFECTS. THIS INVESTIGATION WILL STUDY INDIVIDUALS REPORTED TO THE NAVY BUREAU OF MEDICINE AND SURGERY PER BUMEDINST 6470.13A, PARA 8, WHO HAVE BEEN EXPOSED TO NEMR. LONGITUDINAL MEDICAL EVALUATION OF THE SUBJECTS COMBINED WITH COMPLETE EXPOSURE DOCUMENTATION AND QUANTITATIVE DOSIMETRY AS REQUIRED WILL PROVIDE DATA TO SUPPORT REALISTIC SAFETY STANDARDS FOR NEMR EXPOSURE AND TO ESTABLISH IMPROVED MEDICAL STANDARDS FOR MONITORING WORKERS WHO DEAL WITH NEMR EQUIPMENT.

WHILE LABORATORY EXPOSURE OF HUMAN SUBJECTS OF NEMR AT LEVELS APPROPRIATE FOR THE STUDY OF BIOLOGICAL EFFECTS IS ILL-ADVISED, CERTAIN OCCUPATIONAL EXPOSURES PROVIDE A UNIQUE OPPORTUNITY TO EVALUATE MEDICAL EFFECTS. EXACT DOSIMETRIC INFORMATION IS RARELY, IF EVER, AVAILABLE ABOUT THE PAST OCCUPATIONAL EXPOSURE SITUATION, BUT IN INSTANCES OF THE TIMELY FOLLOW-UP OF SUCH EXPOSURES, MODERN DOSIMETRIC TECHNQUES CAN ACCURATELY DUPLICATE EXPOSURE CONDITIONS AND DETERMINE SPECIFIC ABSORPTION RATE (SAR) IN TISSUES. EXPOSED PERSONNEL WHO REPRESENT AN OPPORTUNITY FOR FRUITFUL RESEARCH IN OCCUPATIONAL NEMR EXPOSURE WILL UNDERGO LONGITUDINAL CLINICAL EVALUATION. QUANTITATIVE DOSIMETRIC DATA WILL PROVIDE THE BASIS TO INTERPRET MEDICAL FINDINGS SUGGESTIVE OF BIOELECTROMAGNETIC EFFECTS AND THEIR PATHOGENESIS IF THEY ARE OBSERVED.

3.0192,

INVESTIGATION OF THE PREVALENCE OF MILITARILY-IMPORTANT DISEASES AND VECTORS IN AFRICA AND THE MIDDLE EAST

T.J. Bucci, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Veterinary Medicine Dept., *FPO, New York, New York* 09527 (DN077693)

DEPARTMENT OF DEFENSE COMMITMENTS TO PRESENT AND FUTURE ALLIES ARE GEOGRAPHICALLY EXTENSIVE. MEDICAL PERSONNEL MUST BE ABLE TO PROTECT HEALTH OF US PERSONNEL THROUGHOUT THE WORLD. THIS STUDY WILL PROVIDE OTHERWISE UNATTAINABLE DATA ON THE CURRENT RISK OF DISEASES WHICH COULD REDUCE EFFECTIVENESS OF FUTURE MILITARY OPERATIONS IN AFRICA AND THE MIDDLE EAST. THE STUDY WILL ALSO AID THE HOST COUNTRY TO PREVENT AND CONTROL DISEASES AFFECTING ITS CIVILIAN POPULATION.

THE STUDY WILL BE PRIMARILY A SERODIAGNOSTIC SURVEY OF HUMANS AND ANIMALS TO MAP THE PREVALENCE OF MILITARILY-IMPORTANT INFECTIOUS DISEASES. IN SOME INSTANCES ARTHROPODS OR OTHER DISEASE VECTORS WILL BE STUDIED. THE HUMANS WILL BE FOREIGN NATIONAL VOLUNTEERS; THEY WILL DONATE BLOOD, URINE AND FECES UNDER SUPERVISION OF PHYSICIANS FROM THEIR OWN COUNTRY. THE ANIMALS WILL BE COMMON DOMESTIC SPECIES (EQUUS CALABIS, EQUUS ASINUS, BOS TAURUS, BUBALUS BUBALUS, CAMELUS DROMEDARIUS; OVIS ARIES; CAPRA HIRCUS; CANIS FAMILIARIS) WILD RODENTS (SPECIES OF MUS, RATTUS, ARVICANTHIS, ACOMYS) AND LABORATORY ANIMALS (MUS MUSCULUS, RATTUS RATTUS; MESOCICRETUS AURATUS, ORYCTOLAGUS CUNICULUS). ALL SPECIMENS WILL BE OBTAINED IN CONJUNCTION WITH LOCAL HEALTH OFFICIALS AND WILL BE ANALYZED WITH A BATTERY OF STANDARD DIAGNOSTIC TESTS. THOSE FOR PARASITIC DISEASE IN HUMANS WILL BE ANALYZED UNDER NAMRU-3 WORK UNIT MR041.09.01-0167. DISEASES SOUGHT WILL BE THOSE WITH MISSION-ABORTING POTENTIAL FOR MILITARY OPERATIONS AND WILL INCLUDE MALARIA, TRYPANOSOMIASIS, AMOEBIASIS, SCHISTOSOMIASIS, HEPATITIS, MENINGITIS, SALMONELLOSIS, ARBOVIRAL DISEASE. RESULTS WILL BE ANALYZED TO REVEAL GEOGRAPHIC PREVALENCE RATES, RESERVOIRS, AND ROUTES OF TRANSMISSION.

3.0193,

EPIDEMILOGY, IMMUNOLOGY AND CLINICAL FEATURES OF BRUGIAN FILARIASIS IN INDONESIA

D.B. Millar, U.S. Dept. of Defense, Navy, Naval Medical Research Inst., Biochemistry Div., *Bethesda, Maryland* 20014 (DN877412)

EPIDEMIOLOGY: TO DEFINE SPECIFIC RESERVOIR HOSTS AND MOSQUITO VECTORS OF BRUGIA MALAYI AND THEIR RELATION TO INFECTION IN MAN. TO DEVELOP ELECTROPHORETIC METHODS TO DISTINGUISH BETWEEN ANIMAL AND HUMAN FILARIAL PARASITES. (2) IMMUNOLOGY: TO CHARACTERIZE PROTECTIVE IMMUNE RESPONSES AND DETERMINBE MECHANISMS OF IMMUNE EVASION AND SUPPRESSION IN FILARIAL INFECTION. (3) CLINICAL: TO EVALUATE LONG-TERM BENEFITS OF DIETHYLCARBAMAZINE (DEC) IN TREATMENT AND CONTROL OF FILARIASIS.

(1) EPIDEMIOLOGY: RECOVER FILARIA FROM SELECTED ANIMALS AND MOSQUITOES FOUND DURING FY79 FIELD SURVEYS TO BE RESERVOIRS AND VECTORS RESPECTIVELY OF BRUGIA PARASITES AT THE ENDEMIC FILARIASIS SITE IN S. KALIMANTAN (BORNEO). ANTIGEN ELECTROPHORESIS AND ANIMAL PASSAGE WILL BE USED TO DISTINGUISH BRUGIAN PARASITES INFECTING MAN FROM THOSE INFECTING ANIMALS ALONE. (2) IMMUNOLOGY: COMPARE PRE-AND POST-TREATMENT STAGE SPECIFIC FILARIAL IMMUNE PROFILES AND IDENTIFY THOSE ANTIBODIES AND CELLULAR IMMUNE RESPONSES WHICH HAVE ANTIPARASITIC ACTIVITY. (3) CLINICAL: CONDUCT BLOOD SURVEYS AND CLINICAL EXAMINATIONS OF POPULATIONS PREVIOUSLY TREATED WITH DEC TO ASSESS LONG-TERM BENEFITS OF CHEMOTHERAPY.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research Inst. funds n.a.

PREDICTION ANALYSIS OF INFECTIOUS DISEASES IN VARIOUS GEOGRAPHIC LOCATIONS

E.R. Cross, U.S. Dept. of Defense, Navy, Naval Medical Research Inst., Data Analysis Div., *Bethesda, Maryland* 20014 (DN977648)

THE DEVELOPMENT OF AN INFECTIOUS DISEASE RISK PREDICTIVE MODEL WHICH WOULD PROVIDE ESTIMATIONS OF THE MORBIDITY AND THE MORTALITY EXPECTED DURING MILITARY OPERATIONS. THE QUESTION TO BE ANSWERED BY THIS MODEL IS: HOW MANY MAN DAYS WILL BE LOST FROM INFECTIOUS DISEASES IN A MILITARY OPERATION INVOLVING A GIVEN NUMBER OF TROOPS IN A GIVEN LOCATION IN THE WORLD AT A SPECIFIED TIME OF THE YEAR? A WORKING GROUP WILL BE CONVENED TO PROVIDE RECOMMENDATIONS ON THE FOLLOWING: (1) THE FEASIBILITY OF CONSTRUCTING A MODEL TO ESTIMATE DISEASE RISK. (2) THE IDENTIFICATION OF FACTORS ESSENTIAL TO THE DEVELOPMENT OF A DISEASE RISK MODEL. (3) THE IDENTIFICATION OF DATA BASES THAT COULD BE EXPLOITED BY THIS SYSTEM. (4) THE CRITERIA ON WHICH THE SELECTION OF THE DISEASE TO BE STUDIED SHOULD BE BASED. VALIDATION OF THE PREDICTIONS WILL BE BASED ON HISTORICAL RECORDS AND ON FUTURE FIELD SURVEYS.

3.0195,

DETECTION OF HYDATID DISEASE IN RESIDENTS OF LINDU VALLEY, CENTRAL SULAWESI, INDONESIA.

J.R. Palmieri, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, *Jakarta Det., APO, San Francisco, California* 96356 (DN977630)

TO DETERMINE THE PREVALENCE OF ECHINOCOCCOSIS IN HUMAN INHABITANTS OF LINDU VALLEY, CENTRAL SULAWESI, USING SEROLOGIC METHODS AND TO DETERMINE THE EPIDEMIOLOGY OF HYDATID DISEASE IN THE LINDU VALLEY BY EXAMINING DEFINITIVE AND INTERMEDIATE HOSTS.

APPROXIMATELY 400 INDONESIAN CIVILIANS LIVING ALONG THE SHORE OF LAKE LINDU WILL BE REGISTERED AND THEIR RELATIONSHIP WITH DOGS FOUND INFECTED WITH ECHINOCOCCUS GRANULOSUS DETERMINED. SERUM SPECIMENS WILL BE OBTAINED AND EXAMINED FOR ECHINOCOCCAL ANTIBODIES BY THE INDIRECT HEMNAGGLUTINATIONA DN BE SCREENED FOR ECHINOCOCCAL INFECTION. DOGS WILL BE PURGED AND STOOLS COLLECTED AND INDIVIDUALLY EXAMINED FOR E. GRANULOSUS. A SURVEY OF NATURALLY INFECTED INTERMEDIATE HOSTS WILL BE CONDUCTED.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2 funds n.a.

3.0196,

ANIMAL INFLUENZA VIRUSES AND THEIR POSSIBLE ROLE IN HUMAN INFLUENZA EPIDEMIOLOGY

T.G. Ksiazek, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, Virology Dept., *Jakarta Det., APO, San Francisco, California* 96356 (DN977620)

TO INVESTIGATE TYPE A INFLUENZA VIRUSES IN FERAL AND DOMESTIC ANIMALS IN ORDER TO ASSESS THE ROLE OF THESE VIRUSES IN THE ORIGIN OF NEW OR RECURRENT INFLUENZA SUBTYPES. THE STUDIES WILL BE CARRIED ON IN THE WESTERN PACIFIC INCLUDING THE INDONESIAN AND PHILIPPINE ARCHIPELAGOES, AN AREA OF THE WORLD RICH IN FAUNA AND FROM WHICH RECENT NEW SUBTYPES OF HUMAN INFLUENZA HAVE EMERGED.

SPECIMENS FROM ANIMALS WILL BE TAKEN IN CONJUNCTION WITH STUDIES INVESTIGATING THE ECOLOGY OF ARBOVIRUSES IN INDONESIA AND THE PHILIPPINES. SWABS OF THE CLOACA AND THE RESPIRATORY TRACT IN BIRDS AND OF THE RESPIRATORY TRACT OF MAMMALS WILL BE TAKEN AND ISOLATION OF VIRUSES ATTEMPTED FROM THEM. ISOLATIONS WILL BE ATTEMPTED IN EMBRYONATED CHICKEN EMBRYOS OR EGG-BIT CULTURES AS WILL AS A CANINE KIDNEY-CELL-LINE. HEMAGEL DIFFUSION, AND NEURAMINIDASE INHIBITION TESTS. RECORDS OF LOCATION, SPECIES, DATA, SEX, AGE, AND SOURCE WILL BE KEPT AND ANALYZED THROUGH THE NAMRU-2 BIOSTATISTICS DEPARTMENT. SUMMARY STATISTICS AND DETAILED LISTS OF ANIMALS SAMPLED AND RESULTS WILL BE SENT TO THE WHO COLLABORATING CENTER FOR THE ECOLOGY OF INFLUENZA VIRUSES IN ANIMALS FOR INCLUSION IN THE SHO DATA BASE ON THIS SUBJECT.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2 funds n.a.

SEAFARERS AS AN INDEX OF PARASITIC DISEASES OF THE INDONESIAN ARCHIPELAGO.

J. Palmieri, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2, *APO Box 14, Taiwan, San Francisco, California* 96263 (DN977629)

TO DETERMINE WHETHER INTER-ISLAND SEAFARERS LIVING ALONG THE NORTH COAST OF WEST JAVA MIGHT SERVE AS AN INDICATOR GROUP OF PARASITIC IDSEASES OF A LARGER GEOGRAPHIC AREA.

SMALL COMMUNITIES OF NATIVE SEAFARERS AND THEIR FAMILIES LIVING ALONG WITH NORTH COAST OF JAVA WILL BE SELECTED AS POTENTIAL INDEX POPULATIONS. THESE SEAFARERS USE SAIL-POWERED PRAUS TO TRADE ALONG THE COASTLINES OF THE MORE THAN 1,000 INHAABITED ISLANDS OF INDONESIA. APPROXIMATELY 100 SEAFARERS AND THEIR FAMILIES WILL BE EXAMINED FOR PROTOZOAN AND HELMINTH PARASITES BY STANDARD LABORATORY METHODS. PARASITIC DISEASE PATTERNS WILL BE RELATED TO SPECIFIC EPIDEMIOLOGIC MARKERS, ESPECIALLY ENVIRONMENTAL AND GEOGRAPHIC EXPOSURES, AND PREDICTION MODELS OF INFECTIOUS DISEASE RISK WILL BE DEVELOPED. PARTICULAR ATTENTION WILL BE PAID TO CHLOROQUINE RESISTANT STRAINS OF MALARIA, TREMATODE INFECTIONS AND FILARIASIS SINCE THESE HAVE FOCALLY DISTINCT GEOGRAPHIC DISTRIBUTION.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research Unit #2 funds n.a.

DISEASES OF MILITARY RELEVANCE: THE INTERACTION OF HEPATITIS B AND SCHISTOSOMIASIS

S. Bassily, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Clinical Tropical Medicine Dept., *FPO, New York, New York* 09527 (DN977581)

HEPATITIS B AND SCHISTOSOMIASIS PRESENT A CHALLENGE TO MILITARY OPERATIONS IN DEVELOPING COUNTRIES BECAUSE OF THEIR PREVALENCE AND THE ABSENCE OF PROPHYLACTIC VACCINES OR DRUGS. SINCE DUAL INFECTIONS WOULD BE EXPECTED TO OCCUR FREQUENTLY IN PERSONNEL DEPLOYED IN THESE AREAS, THE INTERACTION BETWEEN THE TWO DISEASES MUST BE DELINEATED. IT IS IMPERATIVE TO DETERMINE THE EFFECT OF SCHISTOSOMIASIS ON HEPATITIS B CARRIAGE RATES SINCE CARRIERS ARE AN IMPORTANT RESERVOIR OF DISEASE AND TO DETERMINE THE CLINICAL MORBIDITY ASSOCIATED WITH DUAL INFECTION. THIS STUDY ADDRESSES BOTH ISSUES: THE PREVALENCE OF HEPATITIS B CARRIERS WILL BE ESTABLISHED IN POPULATION SUBGROUPS WITH VARYING DEGREES OF SCHISTOSOMIASIS; AND THE 2 YEAR MORBIDITY OF DUAL INFECTION WILL BE COMPARED WITH THAT OF EITHER DISEAS E ALONE.

THE STUDY INVOLVES TWO RURAL EGYPTIAN VILLAGES WHOSE MALE INHABITANTS ARE REGULARLY SCREENED BY OTHER INVESTIGATORS AT 6 MONTH INTERVALS FOR HEPATITIS B SURFACE ANTIGEN AND ANTIBODY. LIMITED PHYSICAL EXAMINATION AND URINE AND STOOL EXAMINATIONS WILL BE PERFORMED ON ALL THESE MALE INDIVIDUALS TO ESTABLISH THE PRESENCE AND INTENSITY OF SCHISTOSOMIASIS IN THE VILLAGERS. THIS DATA WILL THEN BE COMPARED WITH THE PREVIOUSLY OBTAINED SEROLOGICAL DATA. FIFTY VILLAGERS WITH INTESTINAL SCHISTOSOMIASIS, 50 WITH HEPATITIS B ANTIGENEMIA AND 50 WITH BOTH CONDITIONS WHO CONSENT TO ANNUAL HOSPITALIZATION FOR IN DEPTH CLINICAL EVALUATION WILL BE FOLLOWED FOR 2 YEARS IN ORDER TO ASSESS THE RESPECTIVE CLINICAL MORBIDITY OF THE 3 DISEASE STATES.

SURVEY OF EGYPTIAN BAT POPULATIONS FOR VIRAL DISEASES

J.F. Gaines, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Veterinary Medicine Dept., *FPO, New York, New York* 09527 (DN077736)

A NUMBER OF HUMAN AND ZOONOTIC VIRAL DISEASES HAVE BEEN DESCRIBED IN EGYPT. THE MOST PREVALENT ARE RABIES AND RIFT VALLEY FEVER (RVF). RVF AFFECTS MAMMALS, PRINCIPALLY FARM ANIMALS AND HUMANS. IN HUMANS IT IS AN ACUTE, FEBRILE, INCAPACITATING DISEASE WITH OCCASIONAL DEATHS. IT HAS SPREAD THROUGH HUMAN AND ANIMAL POPULATIONS VERY RAPIDLY. RVF, IN ADDITION TO SINDBIS, WEST NILE, AND OTHERS ARE INSECT BORNE. RABIES IS SPREAD BY BITES AND DIRECT CONTACT AND IS USUALLY FATAL. IN OTHER PARTS OF THE WORLD MANY CHIROPTERAN SPECIES (BATS) HAVE BEEN SHOWN TO CARRY, TRANSMIT AND BE POSSIBLE RESERVOIRS FOR RABIES AND MANY OF THE ARTHROPOD BORNE VIRAL DISEASES. THERE IS AN EXCELLENT CHANCE THAT BATS ACT AS A VECTOR AND RESERVOIR FOR RABIES AND THE INSECT BORNE VIRAL DISEASES IN EGYPT SINCE THEY CONSTITUTE A LARGE PROPORTION OF THE MAMMALIAN POPULATION. THIS SURVEY WILL GIVE AN ACCURATE ESTIMATE OF THAT INVOLVEMENT.

BATS OF THE GENERA NYCTERIS, RHINOPOMA, TAPHOZOUS, RHINOLOPHUS, PIPPISTRELLUS, ROUSETTUS, ASELLIA AND OTENYCTERIS WILL BE COLLECTED FROM SUMMER AND WINTER ROOSTING AREAS IN VARIOUS PARTS OF EGYPT. BLOOD AND TISSUES WILL BE COLLECTED AND ANALYZED FOR EVIDENCE OF INSECT BORNE VIRUS AND RABIES BY SEROLOGICAL MEANS AND VIRUS ISOLATION IN ANIMALS. MUS MUSCULUS (MICE) AND MESOCRECETUS AURATUS (HAMSTERS) WILL USED FOR ISOLATION WORK. RVF ANALYSES WILL BE PERFORMED UNDER EXISTING WORK UNIT MR041.09.01-0165.

DISEASE OF MILITARY RELEVANCE: VIRAL HEPATITIS IN AN EGYPTIAN MILITARY HOSPITAL

S. Bassily, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Clinical Investigation Dept., *FPO, New York, New York* 09527 (DN077737)

HEPATITIS A AND B INFECTION POSE A THREAT TO MILITARY PERSONNEL OPERATING IN AN ENDEMIC AREA. INFECTION IS ACQUIRED BY

FECAL-ORAL ROUTE OR FOOD-BORNE IN TYPE A OR BY PARENTERAL ROUTE IN TYPE B. THREE CASES OF CLINICAL HEPATITIS WERE OBSERVED IN A DIALYSIS UNIT AT THE MAADI MILITARY HOSPITAL IN EGYPT AND 100 PATIENTS WITH LIVER CIRRHOSIS ARE CURRENTLY UNDER INVESTIGATION. THIS STUDY ADDRESSES BOTH ISSUES: (A) TO FIND OUT THE PREVALENCE AND INCIDENCE OF HEPATITIS B VIRUS (HBV) AND HEPATITIS A VIRUS (HAV) INFECTIONS IN ALL NURSES OF MAADI MILITARY HOSPITAL WITH STRESS ON THOSE WORKING IN THE DIALYSIS UNIT; (B) IN-DEPTH STUDY IN PATIENTS WITH LIVER CIRRHOSIS.

SERA OF ALL NURSES OF MAADI MILITARY HOSPITAL, PARTICULARLY THOSE WORKING IN DIALYSIS UNIT, WILL BE TESTED PERIODICALLY (EVERY 6 MONTHS) FOR HBSAG, ANTI-HBS, HBEAG, AND ANTI-HBE AND HA USING RADIOIMMUNOASSAY METHOD. (2) SERA OF THE 100 PATIENTS WITH LIVER CIRRHOSIS WILL BE TESTED FOR THE SERO DIAGNOSIS. ALL PATIENTS WILL BE SUBJECTED TO IN-DEPTH CLINICAL STUDY AND CHECKED FOR SCHISTOSOMIASIS INFECTION. RESULTS WILL BE CORRELATED WITH THE LIVER BIOPSY FINDINGS AND PATIENTS WILL BE LONGITUDINALLY FOLLOWED FOR STUDYING THE MORBIDITY OF DISEASES.

3.0201,

EPIDEMIOLOGY OF VIBRIO PARAHAEMOLYTICUS IN EGYPT

J.E. Sippel, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Bacteriology Dept., *FPO, New York, New York* 09527 (DN077727)

VIBRIO PARAHAEMOLYTICUS, THE MOST COMMON CAUSE OF SUMMER DIARRHEA IN JAPAN, IS FREQUENTLY ASSOCIATED WITH GASTROENTERITIS OUTBREAKS IN MANY PARTS OF THE WORLD. ITS POTENTIAL ABILITY TO AFFECT NAVAL POPULATIONS HAS BEEN DEMONSTRATED ON AT LEAST THREE RECENT OCCASIONS WHEN UP TO 60% OF PASSENGERS ON CRUISE SHIPS SUFFERED FROM V. PARAHAEMOLYTICUS INFECTIONS. THESE WERE PRESUMABLY CAUSED BY USING CONTAMINATED SEA WATER FROM THE SHIP'S FIRE CONTROL SYSTEM TO THAW OR WASH SEA FOOD. ALTHOUGH THERE HAVE BEEN MANY REPORTS ON ITS OCCURRENCE INCLUDING SEVERAL FROM THE NAMRU-2 DETACHMENT, DJAKARTA, NO STUDIES FROM THE EASTERN MEDITERRANEAN HAVE APPEARED IN THE LITERATURE. THE AIM OF THIS INVESTIGATION IS TO VERIFY THAT THE ORGANISM RESIDES IN EGYPT AND TO ESTIMATE ITS SIGNIFICANCE AS A CAUSE OF GASTRO-ENTERITIS IN ALEXANDRIA AND NEARBY COASTAL COMMUNITIES.

WATER COLLECTED FROM THE MEDITERRANEAN, ESTUARIES, AND LAGOONS, SEA FOOD SAMPLES, AND RECTAL SWABS FROM PATIENTS SUFFERING FROM GASTROENTERITIS WILL BE INCUBATED IN ALKALINE PEPTONE WATER AT 37 DEGREES C OVERNIGHT AND THEN SUBCULTURED ON TO THIOSULFATE CITRATE BILE SUCROSE AGAR. LARGE BLUE-GREEN COLONIES WILL BE CHARACTERIZED BIOCHEMICALLY TO CONFIRM THEIR IDENTITY, SEROTYPED, AND TESTED FOR ANTIBIOTIC SUSCEPTIBILITY. ISOLATION RATES IN DIFFERENT LOCATIONS, FOOD SOURCES, AND SEASONS WILL BE COMPARED AND INCIDENCE OF DISEASE MONITORED.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3 funds n.a.

3.0202,

INCIDENCE OF BACTERIAL AND PARASITIC ETIOLOGY OF ACUTE DIARRHEA IN EGYPT

M.E. Kilpatrick, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Clinical Investigation Dept., *FPO, New York, New York* 09527 (DN077733)

ACUTE DIARRHEA IS ONE OF THE MOST COMMON DISEASES OF MAN. SALMONELLA, SHIGELLA, AMOEBA AND GIARDIA HAVE BEEN IMPLICATED IN 20% OF ACUTE DIARRHEAL EPISODES. THE EFFICACY AND NECESSITY OF ANTIBIOTIC THERAPY FOR SALMONELLA AND SHIGELLA IS DEBATABLE. THE FECAL LEUKOCYTE EXAM HAS BEEN SHOWN TO DIFFERENTIATE BOWEL-WALL INVASIVE ETIOLOGIES FROM THOSE NON-INVASIVE ETIOLOGIES. THIS STUDY WOULD DOCUMENT THE INCIDENCE OF THESE 4 CAUSES OF DIARRHEA IN EGYPT AS WELL AS EVALUATE THE EFFICACY OF A GLUCOSE-ELECTROLYTE ORAL SOLUTION FOR DIARRHEA NOT DUE TO THE 4 CAUSES. COMPARISON OF GENERAL SUPPORTIVE THERAPY ALONE, WITH A SINGLE DOSE OF ANTIBIOTIC, OR WITH A 5 DAY COURSE OF ANTIBIOTIC WILL BE EVALUATED IN SALMONELLA (NON TYPHI) AND SHIGELLA CAUSED DIARRHEA.

STOOL SPECIMENS WILL BE TAKEN FROM PATIENTS PRESENTING WITH ACUTE DIARRHEA. THESE WILL BE EXAMINED FOR LEUKOCYTES, PARASITES AND SALMONELLA OR SHIGELLA. BASIC TREATMENT WILL BE WITH A GLUCOSE-ELECTROLYTE SOLUTION FOR 5 DAYS, AND SPECIFIC TREATMENT WILL BE BASED ON THE RESULTS OF THE FECAL LEUKOCYTE EXAM AND THE BACTERIAL CULTURE AND PARASITIC EXAMINATION. PATIENTS WILL BE RE-EXAMINED 7-9 DAYS AFTER COMPLETING TREATMENT FOR RESOLUTION OF SYMPTOMS AND REPEAT EXAMINATION OF STOOL FOR LEUKOCYTES, PARASITES AND SALMONELLA OR SHIGELLA.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3 funds n.a.

3.0203,

DIAGNOSIS IN MENINGITIS PATIENTS WITH NEGATIVE BACTERIAL CULTURES

M.E. Kilpatrick, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Clinical Investigation Dept., *FPO, New York, New York* 09527 (DN077728)

CURRENTLY 40-50% OF CASES ADMITTED TO THE MENINGITIS WARD DO NOT HAVE AN ETIOLOGIC AGENT IDENTIFIED AS THE CAUSE OF THEIR DISEASE. THE PURPOSE OF THIS STUDY IS TO IDENTIFY THE VIRAL AGENTS RESPONSIBLE AND TO EXPLAIN WHY BACTERIAL CULTURES ARE NEGATIVE WHEN NO VIRAL AGENT IS IDENTIFIED.

CHARTS OF PATIENTS ADMITTED TO THE NAMRU-3 MENINGITIS WARD OF THE ABBASSIA FEVER HOSPITAL (AFH) DURING 1978 WILL BE REVIEWED TO DETERMINE DOCUMENTED BACTERIAL CAUSES. ACUTE AND CONVALESCENT SERUM OF THESE PATIENTS WILL BE EVALUATED FOR MANY VIRAL AGENTS. PROSPECTIVELY ALL PATIENTS ADMITTED TO THE NAMRU-3 WARD OF AFH WILL HAVE CAREFUL HISTORY AND PHYSICAL DONE. ALIQUOTS OF ADMISSION BLOOD AND CEREBROSPINAL FLUID (CSF) WILL BE EVALUATED FOR ANTIBIOTICS AND VIRAL ANTIBODIES (BY COMPLEMENT FIXATION). ALIQUOTS OF CONVALESCENT BLOOD AND CSF WILL BE EVALUATED FOR A RISE IN VIRAL ANTIBODY LEVELS IN ORDER TO IDENTIFY THE VIRAL ETIOLOGY OF MENINGITIS.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3 funds n.a.

3.0204,

DISEASE AND HEALTH OF AMERICAN MILITARY MEN NEWLY ARRIVED IN CAIRO, EGYPT

M.E. Kilpatrick, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, Clinical Investigation Dept., *FPO, New York, New York* 09527 (DN077732)

IT IS COMMONLY BELIEVED THAT PEOPLE NEWLY ARRIVED INTO AN ENVIRONMENT INITIALLY HAVE A HIGH INCIDENCE OF DISEASE, PARTICULARLY ACUTE DIARRHEA. THIS STUDY WILL DOCUMENT FREQUENCY OF ILLNESS, ETIOLOGY OF ILLNESS, SEVERITY AND DURATION OF ILLNESS IN AMERICAN ACTIVE DUTY MILITARY MEN NEWLY ARRIVED IN CAIRO, EGYPT. ALL NEW ARRIVALS HAVING FREELY GIVEN WRITTEN INFORMED CONSENT WILL BE STUDIED. INITIALLY BASELINE BLOOD, URINE, AND STOOL STUDIES WILL BE DONE AND HISTORICAL BACKGROUND RECORDED. DURING EPISODES OF ILLNESS APPROPRIATE LABORATORY TESTS WILL BE DONE AND THERAPY ADMINISTERED. AT THE END OF EACH INDIVIDUAL'S TOUR OF DUTY IN EGYPT BLOOD, URINE AND STOOL STUDIES WILL BE REPEATED TO VERIFY DISEASE OR DETECT ASYMPTOMATIC DISEASE.

3.0205,

MORBIDITY FORECASE MODEL FOR COLD WEATHER OPERATIONS

L.M. Dean, U.S. Dept. of Defense, Navy, Naval Submarine Medical Research Lab., Personnel Psychology Dept., *Naval Submarine Base, Groton, Connecticut* 06340 (DN977623)

THE OPERATIONAL EFFECTIVENESS OF NAVY AND MARINE COPRS PERSONNEL IN COLD ENVIRONMENTS DEPENDS UPON THE PHYSICAL AND MENTAL FITNESS OF THE TROOPS, THE OPERATIONAL OBJECTIVES, AND OTHER SITUATIONAL AND ENVIRONMENTAL FACTORS. IN ORDER TO PLAN COLD WEATHER OPERATIONS, IT IS IMPORTANT O IDENTIFY THE PERSONEL AND SITUATIONAL FACTORS THAT INCREASE THE RISK OF MORBIDITY OR IMPAIRED EFFECTIVENESS AND TO DEVELOP A MODEL FOR PREDICTING ILLNESS AND COLD INJURY AND THE ASSOCIATED COSTS IN MAN-DAYS LOST.

THE FEASIBILITY OF USING AFTER-ACTION MEDICAL REPORTS FROM PREVIOUS MARINE COPRS COLD WEATHER EXRCIES TO ESTABLISH A MORBIDITY FORECAST MODEL TO PREDICT NON-EFFECTIVE DAY LOSSES DUE TO COLD MORBIDITY WILL BE EVALUATED. ADDITIONAL SOURCES OF SIMILAR DATA WILL BE IDENTIFIED AND APPRAISED WITH RESPECT TO THEIR CONTRIBUTION TO A MORBIDITY FORECAST MODE. PRELIMINARY MULTIVARIATE ANALYSES WILL BE CONDUCTED ON THESE DATA TO IDENTIFY VARIOUS PREDICTORS ASSOCIATED WITH MEDICAL PROBLEMS FOUND IN CODL WEATHER EXERCISES/OPERATIONS.

3.0206,

ASSESSMENT OF BONE AND BODY COMPOSITION IN RECENTLY RETIRED AND ACTIVE DUTY SUBMARINERS

A.A. Messier, U.S. Dept. of Defense, Navy, Naval Submarine Medical Research Lab., Physiology Dept., *Naval Submarine Base, Groton, Connecticut* 06340 (DN077748)

LABORATORY CONTROLLED STUDIES OF VARIABLES PRESENT IN THE SUBMARINE ENVIRONMENT HAVE CONSIDERED THE ROLE OF CARBON DIOXIDE, LACK OF SUNLIGHT LEADING TO DECREASED LEVELS OF VITAMIN D, DIMINISHED PHYSICAL ACTIVITY, ALTERATION IN DIET, AND INTAKE OF DISTILLED WATER LACKING IN TRACE MINERALS AS FACTORS WHICH MAY INFLUENCE CALCIUM METABOLISM AND BE REFLECTED, OVER A PERIOD OF TIME AFTER REPEATED EXPOSURES, BY CHANGES IN BONE MINERAL CONTENT AND BODY ELEMENTAL COMPOSITION. THE IMPLICATION OF THESE FINDINGS IS THAT REPEATED, PROLONGED, SUBMARINE EXPOSURE MAY HAVE AN EFFECT ON CALCIUM METABOLISM. THE OBJECTIVE OF THIS STUDY IS TO ESTABLISH WHETHER ANY DETECTABLE CHANGE IN BONE AND BODY ELEMENTAL COMPOSITION HAS OCCURRED IN A SELECTED GROUP OF ACTIVE AND RETIRED SUBMARINERS WITH MAXIMUM CAREER SUBMERGED TIME.

TWELVE RECENTLY RETIRED SUBMARINERS WHO HAVE HAD CONSIDERABLE SUBMERGED SERVICE TIME WILL BE CHOSEN FOR IN VIVO MEASUREMENTS OF CERTAIN ELEMENTAL WHOLE-BODY CONSTITUENTS BY MEANS OF TOTAL-BODY NEUTRON ACTIVATION ANLAYSIS (TBNAA). SPECIFICALLY, MEASUREMENT WILL BE MADE OF TOTAL BODY CALCIUM, SODIUM, CHLORIDE, PHOSPHORUS, NITROGEN, POTASSIUM, AND BODY WATER. NORMALIZATION OF THE DATA FOR BODY WEIGHT, SEX, AGE, LEAN BODY MASS, AND HEIGHT WILL ALLOW NA INTERCOMPARISON OF THE ABSOLUTE MEASUREMENTS WITH A PREDICTOR CURVE OF 'NORMAL' VALUES DEVELOPED AT THE BROOKHAVEN NATIONAL LABORATORY. IN A SEPARATE PILOT STUDY, A PORTABLE BONE DENSITOMETER WILL BE USED TO ESTIMATE THE BONE MINERAL CONTENT OF FIFTY EXPERIENCED ACTIVE DUTY SUBMARINERS. THE RESULTS OF THIS STUDY WILL INDICATE WHETHER OR NOT CHANGES IN BONE AND BODY MINERAL CONTENT HAVE OCCURRED TO SUCH A GROSS EXTENT THAT THEY HAVE BECOME DETECTABLE BY DENSITY MEASUREMENTS.

3.0207,

AN EPIDEMIOLOGICAL STUDY OF THE HEALTH OF 200 US NAVY DIVERS

M.L. Dembert, U.S. Dept. of Defense, Navy, Naval Submarine Medical Research Lab., Naval Environmental Medicine Dept., *Naval Submarine Base, Groton, Connecticut* 06340 (DN077742)

DIVING IS A STRESSFUL OCCUPATION OF RELATIVELY YOUNGER MEN AND REQUIRES THE INDIVIDUAL TO BE IN EXCELLENT HEALTH. A

REVIEW OF THE LITERATURE SHOWS A PAUCITY OF DESCRIPTIVE STUDIES ON THE LONG TERM EFFECTS OF OCCUPATIONAL DIVING ON MEASURABLE PHYSICAL HEALTH PARAMETERS. MOREOVER, THERE ARE RELATIVELY FEW EPIDEMIOLOGICAL STUDIES WHICH EXAMINE THE RELATIONSHIPS BETWEEN INDIVIDUAL HEALTH AND STRESSFUL OCCUPATIONS AND KNOWN HEALTH RISK FACTORS (E.G., HABITS OF CIGARETTE AND ALCOHOL CONSUMPTION, SERUM CHOLESTEROL) IN YOUNG MEN. THE GOAL OF THIS STUDY IS TO CHARACTERIZE PARAMETERS OF INDIVIDUAL HEALTH AMONG A GROUP OF US NAVY PERSONNEL WITH OCCUPATIONAL DIVING EXPERIENCE. FUTURE COMPARISONS WITH HEALTH STATISTICS FROM OTHER POPULATIONS COULD POTENTIALLY IDENTIFY FACTORS UNIQUELY RELATED TO DIVING ACTIVITY AND LEAD TO RECOMMENDATIONS REGARDING SELECTION OF PERSONNEL, HEALTH MONITORING, AND SO FORTH.

A STORAGE BANK OF HEALTH DATA ON 200 US NAVY DIVERS, COLLECTED AT ONE POINT IN TIME, HAS BEEN PREVIOUSLY GATHERED AT NSMRL. FOR EACH INDIVIDUAL THIS INCLUDES: DIVING HISTORY, COMPLETE MEDICAL HISTORY AND PHYSICAL EXAMINATION, BIOCHEMICAL AND HEMATOLOGICAL STUDIES, RADIOLOGICAL EXAMINATIONS, ELECTROCARDIOGRAPHY, PULMONARY FUNCTION TESTING, ANTHROPOMETRIC MEASUREMENTS, AND PSYCHOSOCIAL TESTING. THE ANALYSIS OF THESE DATA WILL INVOLVE SPECIFIC STATISTICAL PROGRAMS DESIGNED TO DISCOVER SIGNIFICANT RELATIONSHIPS AMONG/BETWEEN THE DATA.

HEALTH AND LONGEVITY IN RELATIONSHIP TO OCCUPATIONAL EXPOSURE IN THE NAVAL SUBMARINE ENVIRONMENT

A. Ostfeld, Yale University, School of Medicine, Dept. of Epidemiology & Public Health, *333 Cedar St., New Haven, Connecticut* 06510 (DN975686)

BECAUSE OF THE RELATIVELY RECENT OPERATIONAL USE OF NUCLEAR POWERED SUBMARINES, THERE IS LITTLE INFORMATION AVAILABLE AS TO THE INCIDENCE OF DISEASE AMONG OLDER PERSONNEL WHO MIGHT HAVE BEEN EXPOSED TO NUCLEAR SUBMARINE ENVIRONMENTS EARLIER IN THEIR CAREERS. THIS WORK UNIT WILL INVOLVE AN EPIDEMIOLOGICAL STUDY OF A LARGE POPULATION OF FORMER NUCLEAR SUBMARINERS TO DETERMINE IF THERE ARE ANY ABNORMAL INCIDENCES OF DISEASE AMONGST THEM.

THE RECORDS OF ABOUT 400,000 RETIRED AND FLEET RESERVE PERSONNEL WILL BE SURVEYED. CAUSE SPECIFIC MORBIDITY AND MORTALITY RATES WILL BE DETERMINED FOR THE TOTAL POPULATION AS WELL AS FOR SUBGROUPS WITH DIFFERENT EXPOSURE LEVELS TO THE SUBMARINE ENVIRONMENT. THE NUMBER OF PATROLS, SPECIFIC RATINGS AND EXPOSURE TO IONIZING RADIATION ARE AMONG THE VARIABLES TO BE INCLUDED.

HEALTH EFFECTS OF ASBESTOS EXPOSURE AMONG PEARL HARBOR NAVAL SHIPYARD WORKERS

L.N. Kolonel, University of Hawaii System, Manoa Campus, Cancer Center of Hawaii, *1997 East West Rd., Honolulu, Hawaii* 96822 (DN675593)

THIS STUDY IS TO ASSESS DISEASE RISKS ASSOICATED WITH VARYING DEGREES OF ASBESTOS EXPOSURE IN A NAVAL SHIPYARD. THE EFFECT OF SMOKING AND OTHER ADVERSE RESPIRATORY EXPOSURES ON THESE RISKS WILL BE EVALUATED.

THE RELATIONSHIPS BETWEEN EXPOSURE TO A PARTICULA R TYPE OF ASBESTOS FIBER AND THE INCIDENCE OF DISEASE AMONG WORKERS IN VARIOUS SHIPYARD JOBS ARE BEING ESTABLISHED. MEASUREMENT OF THE AIR-BORNE ASBESTOS IS MADE WITH INDIVIDUAL SAMPLERS WORN NEAR THE BREATHING ZONE. DIAGNOSIS OF PULMONARY LESIONS AND INTRA-ABDOMINAL TUMORS IS CONFIRMED BY HISTOLOGICAL EXAMINATION. DETAILED CASE HISTORIES REGARDING SMOKING HABITS AND ASBESTOS EXPOSURE ARE OBTAINED. THE DATA IS STORED IN SUITABLE FORM FOR COMPUTER ANALYSIS.

3.0212,

THE APPLICABILITY OF EPIDEMIOLOGIC AND BIOLOGIC MEASUREMENTS FOR THE CONSTRUCTION OF A RISK INDEX FOR ASBESTOS-RELATED DISEASE

H.A. Guirgis, University of California, Irvine Campus, California College of Medicine, Dept. of Community & Environmental Medicine, *Irvine, California* 92664 (DN075660)

THERE IS A RECOGNIZED INCREASE IN CANCER OF THE RESPIRATORY AND DIGESTIVE TRACTS AMONG INDIVIDUALS ENVIRONMENTALLY EXPOSED TO ASBESTOS. IN A POPULATION LIKELY TO BE EXPOSED ROUTINELY TO ASBESTOS, IT IS DESIRABLE TO HAVE THE MOST RELIABLE SURVEILLANCE FOR EARLY SIGNS OF SUCH DISEASE. IT IS THE TECHNICAL OBJECTIVE OF THIS RESEARCH TASK TO IDENTIFY AND EVALUATE RELIABLE AND ACCURATELY MEASURABLE MEDICAL MARKERS SUITABLE FOR ROUTINE USE IN MEDICAL SURVEILLANCE OF NAVY SHIPYARD WORKERS.

A TEST GROUP OF SELECTED SHIPYARD WORKERS FROM THE LONG BEACH NAVAL SHIPYARD WILL BE THOROUGHLY STUDIED. A CONTROL GROUP OF WORKERS, FROM AREAS IN WHICH ASBESTOS EXPOSURE IS NOT A HAZARD, BUT OTHERWISE COMPARABLE, WILL BE USED FOR COMPARISON. THE RELIABILITY OF THE FOLLOWING BIOLOGICAL MARKERS AS INDICES TO SUSCEPTIBILITY AND AS EARLY DIAGNOSTIC TESTS WILL BE ASSESSED: INFLAMMATORY REACTIONS, CHANGES IN IMMUNOLOGICAL STATUS, DNA CHANGES AND HEMATOLOGICAL EXAMINATIONS. THE DATA COLLECTED WILL BE SUBJECTED TO STATISTICAL ANALYSIS TO DETERMINE IF THERE ARE DIFFERENCES BETWEEN ASBESTOS-EXPOSED AND CONTROL GROUPS, AND TO ESTABLISH THE MOST SIGNIFICANT INDICES OF CANCER SUSCEPTIBILITY.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research $107,415

RESEARCH ON HUMAN GENETICS IN ICELAND

S. Fridriksson, Haskola Islands, *Ingolfsstraeti 5, Reykjavik, Iceland*

The Genetical Committee of the University of Iceland will make use of a VAX-11 780 computer system with a 1 MB (1024 KB) memory for its data on the Icelandic human population. The main objective is to link the demographic data of all Icelanders born since 1840 to present into pedigrees and making various medical data available for genetic studies. These studies may provide valuable information on the inheritance of disease and disabilities as well as the consequence of cousin-marriage, their fertility and the viability of their children. It will also give information on various genetic markers, their frequency, and their association with disease. Records of blood groups have been made available by the Blood Bank in Reykjavik and a study of the associations of various types of disease and blood groups and other blood proteins will be carried out. Furthermore, a study of the association of various types of cancer with blood groups and other genetic markers will be continued through linking with the cancer registry. Mental disorers are also gradually being linked to the main register of the Genetical Committee and a study of the fertility of patients with mental disorders is underway.

HUMAN HEALTH EFFECTS FROM ENERGY GENERATION

Unknown, Hanford Environmental Health Foundation Inc., *P.O. Box 100, Richland, Washington* 99352

Hanford Environmental Health Foundation (HEHF) is performing three research projects: the Hanford DOE Health and Mortality Study, U.S. Transuranium Registry 'USTR); and U.S. Uranium Registry (USUR). The task of the Hanford DOE Health and Mortality Study is to determine whether any correlation exists between health patterns and long-term occupational exposure to ionizing radiation while adjusting for other confounding factors. This study has been conducted jointly by HEHF and Pacific Northwest Laboratories (PNL). The USTR is a nationwide autopsy research program. It is designed to study the distribution, concentration and possible tissue effects of transuranics in occupationally exposed workers who volunteer to participate in the study. Such information is important in the evaluation of the radiation injury in various organs and tissues in which these elements accumulate. The USUR is using several approaches to study the effects of uranium exposures on workers in the uranium fuel cycle. These include: (1) an autopsy program similar to the USTR; (2) characterization of the uranium fuel cycle and potential sources of exposure; (3) review of previous epidemiologic investigations, with establishment of priorities for future studies; and (4) design and conduct of appropriate epidemiologic studies. PNL is collaborating with HEHF in accomplishment of the tasks of the USUR.

HEALTH EFFECTS IN THE PETROLEUM INDUSTRY

E.L. Alpen, University of California, Berkeley Campus, Lawrence Berkeley Lab., *Berkeley, California* 94720 (005681 TICNO)

The objective of this project is to examine the health effects of emissions from petroleum refineries and related industries in Contra Costa County, California. Our study populations consist of communities adjacent to refineries and workers engaged in the processing and transportation of petroleum and related products. We are using both direct and indirect studies to compare the health status of occupationally and residentially exposed groups and unexposed control populations. The studies are designed to measure various health outcomes: (1) selected causes of mortality by age; (2) cancer incidence; (3) infertility; (4) congenital malformations; (5) low birth weight and other adverse reproductive effects; and (6) adult and childhood morbidity.

HEALTH AND MORTALITY STUDY

C.C. Lushbaugh, Oak Ridge Associated Universities Inc., *Box 117, Oak Ridge, Tennessee* 37830 (006137 TICNO)

Epidemiologic studies are being conducted on populations of DOE (or DOE contractor) workers whose occupations involve potential exposure to internal and/or external radiation. These workers also have the potential of being exposured to uranium, uranium dust, and such toxic metals as lead, cadmium, and nickel, etc., in nuclear fuel production and enrichment and in the processing of radioactive material related to military applications. The principal aim of these studies is to assess long-term health effects of occupational exposure to low-level ionizing radiation and additive effects by confounding chemical stresses. Current studies concern mortality experience of workers at sites in Oak Ridge (Y-12 Tennessee Eastman Corporation, Y-12 Union Carbide, X-10, and K-25 plants), other current DOE facilities (Paducah, Portsmouth), disbanded Manhattan Engineering District (MED) sites (Mallinckrodt, Linde, Columbia University, Middlesex), and other selected sites (National Lead of Ohio, Mound, Savannah River, Argonne National Laboratory, Brookhaven National Laboratory, Idaho Test Site, and Nevada Test Site). Statistical methods and data-management techniques are being developed through methodology research for improving the power of epidemiologic analysis of low-level stresses to large numbers of people. This biostatistical research also provides record-linkage algorithms and statistical data-editing procedures to facilitate handling problems generic to using large complex data sets in longitudinal cohort studies. The long-range goal of this project is to be able to merge all occupational, rosters, radiation exposure records and other pertinent data from all MED/AEC/ERDA/DOE sites since 1942 into a National Atomic Energy Worker Roster to provide as many as possible person year rems for radiation risk assessment and a basis for a continuous health and safety survey for DOE workers.

IVEP-HEALTH EFFECTS

L. Anspaugh, University of California, Central Office, Lawrence Livermore Lab., *P.O. Box 808, Livermore, California* 94550 (005816 TICNO)

The Health Effects Element of the Imperial Valley Environmental Project (IVEP) will perform four major tasks. First, we will review the health literature for the effluents known or expected to be released by geothermal energy utilization, compile a priority ranking of pollutants, and, if appropriate, recommend needed research. Second, we will establish an exemplary system for reporting and analyzing Imperial County health statistics, including morbidity and mortality. The third task is to review and perhaps to supplement the health surveillance of workers in the geothermal industry. Fourth, we will conduct a background survey of odor and noise annoyance perceptions in Imperial County. These studies will be conducted with the collaboration and contracted assistance of the Imperial County Department of Health and the California Department of Health Services.

MOLECULAR PERTURBATIONS IN MAN PRODUCED BY ENERGY RELATED POLLUTANTS

N.G. Anderson, U.S. Dept. of Energy, Div. of Biological & Medical Research, *9700 S. Cass Ave., Argonne, Illinois* 60439 (005245 TICNO)

Radiation and energy-related toxic agents may produce a variety of biological effects including DNA breakage, altered DNA repair, mutation, altered gene expression, cancer, or cellular toxicity, accelerated aging, and cell death. These effects can only be understood in terms of a wide range of molecular mechanisms involving the estimated 30 to 50,000 protein gene products (PGP's) encoded by the human genome. We have developed the systems and techniques required to see a large fraction of all human PGP's and to index them in a rational manner. This makes possible a revolution in energy-related biomedical research since effects may now be studied in terms of specific molecular species. For the study of PGP's we have developed mapping systems and techniques for using high resolution two-dimensional electrophoresis techniques for spot identification, for determining a number of identifying biophysical properties and compositional characteristics for each PGP, and for image analysis and data reduction. Maps and multiple identifications for PGP's in human plasma, muscle red cell lysates, and urinary protein concentrates have been prepared and published. Emphasis now centers on the indexing of PGP's of human peripheral lymphocytes, and on changes in the pattern of gene expression in these cells in response to radiation, carcinogens, toxic chemicals, and hormones.

EPIDEMIOLOGY OF MAGNETIC EFFECTS

T.F. Budinger, University of California, Berkeley Campus, Lawrence Berkeley Lab., *Berkeley, California* 94720 (005684 TICNO)

This epidemiological study on the health effects of static and slowly varying magnetic fields is designed to acquire data on both long term low level and acute high level exposure to magnetic fields. The data can be used to evaluate risks to populations near facilities which cause increased environmental magnetic fields and to technical workers at the facilities. Workers at the national laboratories are chosen for this study both for their exposure to magnetic fields and their excellent medical records. Matched controls are selected for each exposed subject. Medical records and exposure levels are coded for exposed and control subjects. Statistical tests are used to analyze the results. We expect 1000 exposed subjects and 1000 controls to be available in North America. Statistical analysis indicates that with this sample size a threefold increase or decrease in the incidence of cardiovascular disease can be detected. The retrospective survey will be complete in FY 1981 and form the basis for a prospective epidemiology study using a cohort of exposed and control subjects.

DOSIMETRY FOR HUMAN EXPOSURE

G.D. Kerr, U.S. Dept. of Energy, Oak Ridge National Lab., *P.O. Box X, Oak Ridge Operations Office, Oak Ridge, Tennessee* 37830 (003910 TICNO)

The objective of studies on the dosimetry of human exposures is to improve techniques for assessing the risk to man from gamma-ray and neutron exposures. This has involved detailed investigations and predictions of radiation interactions within the body at the microscopic and macroscopic levels, and results of these studies have been used by national and international committees in establishing current radiation protection criteria. These studies are now providing significant new refinements in the estimation of radiation exposure risks using data from clinical and epidemiological studies of atomic-bomb survivors by the Radiation Research Foundation (RERF) in Japan. The RERF's studies are the most extensive source of data on the latent effects of human radiation exposures and the only major epidemiological study providing data on the latent effects of human neutron exposures.

RADIATION INSTRUMENTATION - RADIOLOGICAL CHEMISTRY

N.A. Wogman, U.S. Dept. of Energy, Battelle Pacific Northwest Lab., *P.O. Box 999, Richland, Washington* 99352 (004970 TICNO)

This program is primarily concerned with the development of radiochemical instrumentation and analytical technology for the measurement of low levels of radionuclides which enter the environment from the nuclear industry and from nuclear testing operations. It is also concerned with the development and refinement of neutron activation analysis technology for the analysis of trace elements released to the environment from fossil fuel combustion, coal conversion, oil shale retorting, and geothermal power generation. In the nuclear fuel cycle, the transuranium and long-lived fission products are of immediate concern. Instrumentation and technology are developed for the measurement of radioisotopes in environmental samples. Coupled with neutron activation, these techniques are subsequently used to define the pathways of natural or waste radioisotopes and toxic, stable elements in the environment. Efforts are in three parts: low-level radiochemical laboratory techniques, in situ monitoring techniques, and activation analysis technology. Low-level radiochemical laboratory techniques which are developed and improved include x-ray, beta-gamma, alpha-beta-gamma, and gamma-ray radiation detection systems for the analysis of ultra-low levels of radioactive species. In situ monitoring technology is being developed to allow real-time determination of natural or field-induced radioactivity under field conditions. The designed systems are directly applicable to radionuclide measurement problems in the nuclear industry. Activation analysis technology is developed for improved handling and increased sensitivity in the measurement of various trace elements harmful to man over a wide spectrum of environmental materials.

DETERMINATION OF PLUTONIUM IN MAN

J.F. McInroy, University of California, Central Office, U.S. Dept. of Energy Los Alamos Scientific Lab., *P.O. Box 1663, Los Alamos, New Mexico* 87545 (006024 TICNO)

This study is designed to: (1) establish the annual baseline levels of plutonium in the tissues of the general population due to worldwide or regional environmental contamination; (2) establish the uptake and distribution patterns of plutonium in the human body; and (3) measure plutonium concentrations in tissue for individuals occupationally exposed to plutonium. Tissues are collected at autopsy of persons in the general population who have had no known occupational exposure to plutonium and of former nuclear industry employees having had a potential for an occupational exposure to plutonium. The latter includes cases from several facilities throughout the U.S. that have had exposures and have signed autopsy consent forms with the U.S. Transuranium Registry. All tissues are analyzed for plutonium and, additionaly, the tissues from the occupational cases are analyzed for americium. Data are being accumulated continuously to evaluate the time-related effects of fallout Pu deposition and retention and also to monitor possible increases in tissue concentrations due to accidental releases from nuclear facilities. Statistical evaluation of existing data is being expanded. In vivo methods for estimating the body content of Pu in occupational exposures are being compared with the content determined from direct tissue analyses. Techniques for determining the distribution of Pu in microstructure of lungs and bone are being evaluated using fission track analysis, electromicroprobe analysis, autoradiography, etc.

HEALTH EFFECTS OF ENERGY-RELATED POLLUTANTS

Unknown, U.S. Dept. of Energy, Brookhaven National Lab., *Upton, New York* 11973 (005521 TICNO)

This research project aims to elucidate the relationships between air pollution, health, and population dynamics, specifically mortality and migration and to a lesser extent fertility in the United States. An epidemiological model will be used to examine the functional relationships between various social, demographic, and environmental variables, and to formulate hypotheses regarding the association of air pollution to changes in these variables. Primary consideration will be given to consistency of these hypotheses: (1) with each other; and (2) with current knowledge. A modular approach will be used to organize the extensive body of data required for this multidisciplinary study. Using concentration data, local emission data, and meteorological transport models, the agent module will focus on the identification of various airborne pollutants and the quantification of their respective doses to the population. The host module will address inherent biological factors, such as age, sex, physiologic and genetic variables, and their differential effects on a hypothesized pollution/health interrelationship. The environment module will focus on such characteristics associated with individual's habitats and lifestyle. Primary effects on health, including changes in mortality, morbidity, and health resources utilization, will be used to measure the postulated pollution damage, while secondary effects such as changes in population structure and social costs, will also be evaluated.

ENERGY PRODUCTION AND HUMAN HEALTH

M.E. Ginevan, U.S. Dept. of Energy, Argonne National Lab., *9700 S. Cass Ave., Argonne, Illinois* 60439 (005179 TICNO)

Evaluation of the merits of alternative energy technologies for our country's future requires accurate assessments of their probable human health consequences. The present research develops new statistical methodology, mathematical models, and data bases of relevance to the assessment process, and uses these to identify, quantify, and predict adverse health effects of energy related pollutants. Efforts are in four related areas: (1) development of a national data base of demographic, socioeconomic, climatic, and pollution variables to be used in exploring the multivariate relationships associated with variation in human mortality data; (2) studies of a second national data base consisting of 50% samples of all U.S. births for the years 1968 to 1975; preliminary results suggest that birth weight measures may provide an early warning system for the effects of environmental pollution; (3) evaluation and development of statistical procedures for the analysis of death rate and disease incidence data; and (4) development of dose response and demographic models useful in the prediction of the health effects of energy technologies. The ultimate goal of these related lines of inquiry is to provide persons responsible for the assessment of health impacts with a unified body of fact and theory upon which they may base their analyses.

HUMAN HEALTH FROM RADIONUCLIDES IN ENVIRONMENT

P.W. Durbin, University of California, Berkeley Campus, Lawrence Berkeley Lab., *Berkeley, California* 94720 (005678 TICNO)

Nuclear energy facilities are potential sources of radionuclides, which are hazardous to human health if inhaled or ingested. A complete assessment of those hazards includes quantitation for each nuclide of the source terms, transport pathways, human metabolism, internal dosimetry, and dose-response relationships. Most existing risk assessments for nuclear facilities are not as accurate or complete as is desirable, because when prepared, specific information was lacking and analytical methods were undeveloped. A variety of data bases, models, and calculation methods have been devised by several groups working independently, and the multiplicity of approaches to risk assessment create public confusion and regulatory difficulties. In the last 5 years new compilations have appeared of biologic data for several important radionuclides, metabolic and dosimetric models, estimates of human radiation dose-response relationships, and data on environmental transport and metabolism of the actinide elements. This project will accomplish four tasks: (1) compile needed data for important, but incompletely treated radionuclides; (2) prepare specifically for use in risk assessments synopses of biologic data, models, and dosimetric calculation methods; (3) assist development of uniform approaches to risk assessment for nuclear facilities; and (4) modernize existing risk assessments for specific aspects of nuclear fuel cycles.

DOSE REASSESSMENT FOR RONGELAP AND UTIRIK

J.R. Naidu, U.S. Dept. of Energy, Brookhaven National Lab., *Upton, New York* 11973 (005508 TICNO)

An in-depth study of all information pertaining to BRAVO test fallout on Rongelap and Utirik will be made. In addition, using advanced analytical and computer techniques, a comprehensive fallout model will be developed. Using this model in conjunction with dietary and life style patterns prevalent at time of exposure, a reassessed dose estimate - internal and external - will be made for the populations of Rongelap and Utirik. These dose estimates will be evaluated in terms of the thyroid nodule incidences in these populations, and the results obtained will provide information towards correlating doses and radiation effects.

HUMAN HEALTH EFFECTS OF PLUTONIUM

G.L. Voelz, University of California, Central Office, U.S. Dept. of Energy Los Alamos Scientific Lab., *P.O. Box 1663, Los Alamos, New Mexico* 87545 (006025 TICNO)

Possible late health effects from plutonium deposition are searched for in plutonium workers in this long-term retrospective/prospective study being conducted at Los Alamos, Rocky Flats, Mound, Savannah River, Hanford, and Oak Ridge. Age-specific mortality rates from all major causes of death, with special emphasis on cancer, will be estimated, and dose-response relationships derived using plutonium deposition estimates. A subset of 8000 workers, including controls, will be actively followed. Questionnaire or interview studies of other risk factors, such as tobacco use and occupational histories, and of morbidity from cancer, cardiovascular, respiratry, and other chronic diseases will be done. Preliminary studies in progress include a clinical study of 26 Manhattan District workers at Los Alamos, a mortality study on 241 highest exposed Los Alamos workers, a study of cancer incidence and mortality in residents of Los Alamos County, and case-control study of cancer in Los Alamos.

MEDICAL STUDIES OF THE PEOPLE OF THE MARSHALL ISLANDS ACCIDENTALLY EXPOSED

H.S. Pratt, U.S. Dept. of Energy, Brookhaven National Lab., *Upton, New York* 11973 (005509 TICNO)

The primary objective is the determination of the lifetime effects of fallout radiation on the Marshallese who were accidentally exposed to radioactive fallout on March 1, 1954. Medical Surveys of these people have been conducted at quarterly intervals, and an unexposed Rongelap population is examined for comparison. The surveys, carried out jointly by Brookhaven National Laboratory under the auspices of the Department of Energy, and the Trust Territory of the Pacific Islands, are of great importance in view of the development in this population of growth impairment in some exposed children, thyroid lesions, and one case of acute leukemia.

DEATH CERTIFICATE RETRIEVAL OFFICE

C.C. Lushbaugh, Oak Ridge Associated Universities Inc., *Box 117, Oak Ridge, Tennessee* 37830 (006138 TICNO)

The Death Certificate Retrieval Office (DCRO) supports Department of Energy sponsored epidemiologic studies by providing vital status follow-up of DOE/DOE-contractor workers. An important function which the DCRO performs is to act as a single point of contact with the Social Security Administration (SSA) which is one of the most complete sources of information concerning vital status in U.S. worker populations. The DCRO also uses a variety of methods such as searches of state death indices to determine vital status and to cross reference these results for validity. After a worker has been identified as deceased, the DCRO conducts a search for a death certificate. When the death certificate is found, the DCRO verifies the certificate as the one sought. It is then reviewed by a nosologist for cause-of-death coding. The coded death certificates are then sent to the user requesting the vital status search. If a worker's status is undetermined, the DCRO attempts to determine the status via methods approved by epidemiologists conducting the study. Results from these searches are then reported to investigators to fullfill their request.

HEALTH AND ENVIRONMENTAL ASSESSMENTS FOR ENERGY TECHNOLOGIES

L.R. Anspaugh, University of California, Central Office, Lawrence Livermore Lab., *P.O. Box 808, Livermore, California* 94550 (005858 TICNO)

The purpose of this task is to assist DOE in preparing comprehensive, quantitative evaluations of the environmental and human-health impacts of energy-producing technologies and of energy and environmental policy applications. The general approach is to consider the residual effluents of a particular technology, model the transport and fate of these effluents, and then calculate the human-health and environmental impacts. This last step is most difficult at the present time because of the lack of adequate response-vs-dose functions; the derivation of these functions will be one of the primary foci of this task. We anticipate that this task will be part of a larger DOE program to accomplish this purpose and that our efforts will focus on producing an annual health and environmental effects assessment for geothermal energy development.

NATIONAL CHLORINATION CONFERENCE

W.W. Pitt, U.S. Dept. of Energy, Oak Ridge National Lab., *P.O. Box X, Oak Ridge Operations Office, Oak Ridge, Tennessee* 37830 (003976 TICNO)

International concern about the effects of chlorination during water treatment requires increased attention from the scientific and engineering community. Evidence has been presented at the first three national conferences on water chlorination that there are certain health and environmental problem areas associated with chlorination practices.Approximatly 300 scientists attended each conference. The proceedings of the third conference will be published in May 1980 and will report a significant fraction of the research conducted nationally and internally in this subject area. Planning is starting for the fourth conference tentatively scheduled for October 1981. The chlorination of cooling waters for electric power generating plants and associated environmental problems in freshwater, estuarine, and marine ecosystems is a subject of continuing concern for the Department of Energy. The U.S. Environmental Protection Agency, the National Cancer Institute, the U.S. Nuclear Regulatory Commission, and the Tennessee Valley Authority also co-sponsored the third conference.

POPULATIONS AT RISK TO ENVIRONMENTAL POLLUTION

S. Selvin, University of California, Berkeley Campus, Lawrence Berkeley Lab., *Berkeley, California* 94720 (005680 TICNO)

The Populations at Risk to Environmental Pollution (PAREP) project is conducting epidemiologic investigations into the relationship between diseases (particularly cancer) and environmental pollution using an environmental data base established at Lawrence Berkeley Laboratory. The data base contains, for each county in the United States, information on air quality, human mortality, geographic location, and a number of socio-economic indicators. In 1979--1980, the data base was supplemented with more inclusive air-quality data and with information on age-specific mortality and cancer incidence. The resulting integrated data base will be used for carrying out several specific epidemiologic studies in 1981 and 1982 as well as a study of leukemia based on new data sources.

STATISTICAL STUDIES OF HEALTH EFFECTS

Unknown, U.S. Dept. of Energy, Battelle Pacific Northwest Lab., *P.O. Box 999, Richland, Washington* 99352 (004543 TICNO)

The primary objective of this program is to analyze the mortality of Hanford workers and particularly to assess the effect of radiation exposure in this population. Data collected for this study are the principal source of information regarding the health of workers in the nuclear industry and also provide one of the best available opportunities for assessing directly the health effects of low-level chronic radiation exposure. Methods which are developed for this task should prove useful to others with similar data involving chronic exposure to radiation and other substances. Methods of analysis include comparing death rates of Hanford workers with US vital statistics and relating death rates to the radiation exposure that has been received. The latter analysis is based on the proportional hazards model of Cox and involves comparing the exposures of workers who have died with those at risk of dying with careful control for possible confounding variables. With increased complexity of the analyses, the services of full-time computer analyst have been engaged. This will also accelerate the development of new findings. We, therefore, request an increase in budget over that previously projected for fiscal year 1981.

OCCUPATIONAL HEALTH AND MEDICAL RESEARCH

Unknown, University of California, Berkeley Campus, Lawrence Berkeley Lab., *Berkeley, California* 94720

This work package includes research directly related to occupational exposure and medical effects of energy generation. A single epidemiological program is examining the effects of high magnetic fields associated with energy generating options such as MHD and Magnetic Fusion. The work continues with collection and analysis of health data on individuals occupationally exposed at accelerator and related machinery. A group of programs has been devised to use laboratory models to explore the effects of energy pollutants on the various organ systems that might be at high risk, either occupationally or environmentally. The agents being used for these studies include the oxidant gases, ozone, nitrogen oxides, and sulfur oxides, as well as heavy metals and organic pollutants. The systems being examined are the endocrine organs, the reproductive organs, the brain, and the lung. Some research is also underway to examine the effectiveness of treatment modalities in the removal of toxic substances. The present approach is the use of new chemical removal agents for plutonium.

HEALTH EFFECTS OF FOSSIL FUEL PROCESSES

B.H. Mayall, University of California, Central Office, Lawrence Livermore Lab., *P.O. Box 808, Livermore, California* 94550 (005819 TICNO)

This project establishes a coordinated program for the early detection of delayed and potentially serious effects on human health of exposure to noxious agents. A battery of tests designed to detect precancerous lesions and genetic damage are applied to samples of blood, urine, and semen. The samples are obtained from workers and other persons at risk based on their significant exposure to noxious pollutants from fossil fuel technologies. The tests currently are in use or are under development, and measure: sister chromatid exchange rate; incidence of erythrocytes with mutant hemoglobin; proteolytic enzyme profiles of serum; mutagenic activity of serum and urine; urinary cytology; and frequency of abnormal sperm in semen. Test results are correlated with epidemiological input concerning donor health and medical, workplace, and exposure history, etc. We propose a longitudinal study of oil refinery workers, grouped into cohorts at high or low risk for exposure to noxious agents. Individuals will be tested annually for sister chromatid exchanges, urinary cytology, sperm morphology, etc. Results will be compared between cohorts and will be correlated prospectively for individual exposure and subsequent health status.

DIESEL: HEALTH RISK ASSESSMENT

F.G. Cuddihy, Lovelace Center for the Health Sciences, *5200 Gibson Blvd. S.E., Albuquerque, New Mexico* 87108 (106316 TICNO)

This task is directed toward providing a series of integrated assessments of the human health risks associated with various scenarios for the utilization of diesel engines in light-duty vehicles. The integrated assessment will have three major contributing assessments. The first is a human exposure assessment to predict human exposures. It will be made using data on emission levels, the physical and chemical characteristics of the emissions (especially particles), their dispersal under various traffic patterns (e.g., metropolitan street canyons, urban freeways, open country roads), diesel production scenarios and demographic statistics. The second is a human dose assessment which will predict tissue levels of particle constituents, especially hydrocarbons, resulting from the exposure levels derived in the exposure assessment. This will be done using the physical and chemical characteristics of emissions, knowledge of particle deposition and clearance in man and laboratory animals, and data on the dissociation of hydrocarbons from particles gained from in vivo and in vitro studies. The third assessment will predict human health effects for various levels of exposure. It will utilize the results of human epidemiologic studies, studies of animals exposed in controlled environments, and short-term assays. The integrated assessment will seek to establish the relationships between source, exposure environment, dose to people, and health effects for the total population. Where possible, comparisons will be made to other transportation technologies that result in potential health risks to man. The assessments will be performed in an iterative manner with a view to providing improved estimates of risks as additional input data become available from the on-going parallel research effort.

EVALUATION OF HEALTH EFFECTS OF AIR POLLUTION IN CHESTNUT RIDGE AREA

J. Gruhl, Massachusetts Inst. of Technology, Energy Lab., *77 Massachusetts Ave., Cambridge, Massachusetts* 02139

This project involves several tasks designed to take advantage of (1) a very extensive air pollution monitoring system that is operating in the Chestnut Ridge region of Western Pennsylvania; and (2) the very well-developed analytic dispersion models that have been previously fine-tuned to this particular area. The major task in this project is to establish, through several distinct epidemiological approaches, health data to be used to test hypotheses about relations of air pollution exposures to morbidity and mortality rates in this region. Another important goal of this project is to collect and test the many available models for associating health effects with air pollution, to determine their predictive validity and their usefulness in the choice and siting of future energy facilities. Some of the preliminary statistics and results of the first to health data collection exercises are presented. The principal emphasis of this report is, however, on the analytic techniques and examples that convey information about the exposure profiles that characterize the air pollution patterns in the area. Significant findings include the fact that the exposure is not easily characterized by one or two parameters, in fact about 50 parameters appear to be needed in order not to lose important information. In addition, exposures are not well correlated from year to year, and are in certain instances negatively correlated from one pollutant to the next. These conclusions introduce a tremendous number of variables that must be considered in the characterization of air pollution exposure.

DEVELOP ALTERNATIVE FORMS FOR PRESENTING ENVIRONMENTAL, SAFETY, AND HEALTH IMPACT INFORMATION

Unknown, TERA Inc., *Arlington, Virginia* 22209 (104064 TICNO)

During the first year, the contractor will examine the relationship between worker health and worker environment in six navy shipyards and one private yard. The study population is comprised of approximately 250,000 workers employed since the early 1950's. The actual study will consist of the construction of an automated data base of all relevant information on individual work histories of all workers employed since the early 1950's. Existing Federal and state information systems will be queried to identify separated employees that have died. Death certificates for these persons will be obtained. In the second year, research of vital records, social security, etc., and tracing occupational histories of each worker who died will continue. Each subject will be classified by job class, thereby developing an individual work history profile for each worker. Analysis of data will begin using a variety of life table.

PREVENTION OF ABUSE AND NEGLECT IN INFANTS DISCHARGED FROM NEONATAL INTENSIVE CARE UNITS

J.H. Penticuff, Seton Medical Center, Dept. of Nursing, *1201 W. 38th St., Austin, Texas* 78705 (CMA-179)

The aim of this hospital-based perinatal project is to demonstrate the effectiveness of parent support services and the utilization of risk indicators in reducing child abuse and neglect of infants who have required neonatal intensive care. The incidence of child abuse and neglect in premature and seriously ill newborns is from three to nine times that reported among normal infants.

Risk indicators validated through project activities will allow identification of families at greatest risk for parenting dysfunction. Supportive interventions will be employed to foster parent-infant affectional ties, to reduce emotional and environmental stress, and to promote family coping.

A 12 month follow-up will assess the physical, cognitive, and relationship development as well as incidence of abuse and neglect of infants classified as high and low risk by project risk indicators.

Project co-sponsors are Seton Medical Center and Brackenridge Hospital, located in Austin, Texas. The neonatal intensive care unites of these hospitals serve a combined total of approximately 500 infants per year.

The project setting affords the evaluation of services to the tri-ethnic (Black, Mexican-American, and Anglo-American) population of metropolitan Austin and the surrounding predominantly rural multi-county area.

DETERMINING THE INCIDENCE OF CARPAL TUNNEL SYNDROME IN UREMIC PATIENTS ON RENAL DIALYSIS

S. Halter, University of Washington, Medical Rehabilitation Research & Training Center, *15th Ave. N.E., Seattle, Washington* 98105

OBJECTIVES: Most of the previously reported studies of CTS in uremic patients on dialysis are anecdotal and include numbers of patients. None of the studies, as reported, has met rigid electrodiagnostic criteria for evaluation of CTS. Our experience to date suggests that uremic patients have a higher incidence of carpal tunnel syndrome than previously thought. The purpose of this study is to determine the incidence of CTS in the Seattle VAMC population of uremic patients on renal dialysis, using standardized electrodiagnostic techniques and recording hand and forearm temperature. Patients will be selected from a population of uremic patients who have been on renal dialysis for various lengths of time, the majority for greater than five years.

METHODOLOGY: The majority of patients complaining of symptoms which might correlate with CTS have been on dialysis 5 years plus or minus 4 months. The total VA population of renal dialysis patients is 100, and 38 of these have been on dialysis 5 years plus or minus 4 months. Of the 38, one has transferred to Tennessee, and six have had renal transplants and are eliminated from the study. We will attempt to test all of the remaining 31 patients. Twelve of the 31 have symptoms which might be found in CTS, and 19 are asymptomatic.

Any symptomatic patients who have been on dialysis less than 5 years plus or minus 4 months will also be tested. In addition, a random sample of 10 asymptomatic patients who have been on dialysis for varying times less than five years will be tested.

A DISA will be used for all testing. Rectangular pulses of 0.1 to 0.5 msec will be used with supramaximal stimulus intensity to 99 milliamps. Temperature will be measured at the midflexor wrist crease and thenar eminence using a Rochester Electromedical Thermistor with surface probe after the subject has been in the room for 15 minutes.

Median and ulnar standardized NCV techniques described by Melvin (12, 13) will be used. For median motor conduction studies, the active electrode will be placed over the opponens pollicis, half the distance between the MCP joint of the thumb and the midpoint of the distal wrist crease. The ground electrode will be placed on the dorsum of the hand and the reference electrode on the distal phalanx of the thumb. The cathode will stimulate the median nerve

INDIVIDUAL DIFFERENCES IN SURVIVAL AND REPRODUCTION AMONG OLD COLONY MENNONITES

G. Allen, U.S. Dept. of Health & Human Services, Public Health Service, Alcohol Drug Abuse & Mental Health Admin., National Inst. of Mental Health, Laboratory of Psychology & Psychopathology, *Bethesda, Maryland* 20014 (Z01 MH 00488-15 LPP)

This study was undertaken to seek evidence of natural selection with respect to human behavioral characteristics. The population chosen consisted of about 13,000 German-speaking Mennonites whose culture resembles in many respects that of pre-industrial European peasants.

A census-survey was made in 1967 and vital records of the church were copied. For 569 families in the file, data include complete vital records and factor scores on several dimensions of social and economic behavior. Lengthy editing processes have now been completed and final analysis is being planned. This will first, specify parameters of survival and reproduction; second, explore interrelations among vital events such as effect of infant mortality on birth intervals, third, examine the effects on fertility of such variables as wealth, medical care, and social status.

BEHAVIORAL PROBLEMS AND COMPETENCIES OF CLINIC-REFERRED AND NONREFERRED CHILDREN

T.M. Achenbach, U.S. Dept. of Health & Human Services, Public Health Service, Alcohol Drug Abuse & Mental Health Admin., National Inst. of Mental Health, Developmental Psychology Laboratory, *Bethesda, Maryland* 20014 (Z01 MH 00263-04 LDP)

In order to compare the behavioral problems and competencies reported for clinic-referred and nonreferred (normal) children, a survey of 1300 randomly selected parents in the Washington, D.C. area was conducted. Home interviewers administered the Child Behavior Checklist to parents of 50 boys and 50 girls at each age 4 through 16. The results have been compared with parental reports of problems and competencies for clinically referred children matched to the nonreferred children for age, sex, socioeconomic status, and race in order to provide a unique epidemiological baseline for research on child psychopathology and the effectiveness of various treatments.

EPIDEMIOLOGY OF PSYCHIATRIC NEED AND PRIMARY CARE

D. Mechanic, Rutgers the State University of New Jersey, New Brunswick Campus, Graduate School of Social Work, *Old Queens Bldg., New Brunswick, New Jersey* 08903 (R01 MH 33940-02)

This project examines the effects of psychological disorder and social need on patterns of medical care utilization, physician disposition of patient problems, treatments provided, and processes of referral to psychiatric services. Three samples were surveyed in a population area that was substantially rural but served by a single large multispecialty group practice: a sample of 1026 persons representative of the community population, 114 patients in this population seeking psychiatric care, and 316 Medicaid recipients residing in the same geographic area. Data from patient interviews have been merged with information from medical and pharmaceutical records for the 12-month period following interview. Psychological disorder, social need, sociodemographic characteristics, and group structure variables are used as predictors of patterns of utilization of medical and psychiatric services, disposition and referral by primary care practitioners to specialized psychiatric services, prescription of psychoactive drugs by primary care physicians and psychiatrists, and use of nonprescription drugs. Patterns are examined in relationship to various financial arrangements for services including prepaid group practice and fee for service, and whether the patient receives medical care from the centralized clinic or from its satellites. A major focus of the study is the way in which management of psychological disorder and social need by the mainstream medical care system affects patterns of subsequent utilizattion of medical resources and patient outcomes.

3.0254,

EPIDEMIOLOGY OF DEPRESSION AMONG AMERICAN INDIANS

J.H. Shore, Oregon State Higher Education System, University of Oregon Health Sciences Center, School of Medicine, Dept. of Psychiatry, *3181 S.W. Sam Jackson Park Rd., Portland, Oregon* 97201 (R01 MH 33280-02)

This project is a proposal to study the epidemiology of the spectrum of depressive reactions in American Indian cultures. Since there is substantial evidence that cultural differences among American Indian tribes significantly effect behavior patterns and depressive reactions, this study is designed to compare the epidemiology of depression in a major southwestern tribe, the Papago, and a tribe of the northern plains, the Oglala Sioux. The research will be sponsored by the Department of Psychiatry at the University of Oregon Health Sciences Center in affiliation with the White Cloud Center for Mental Health Research and Development for American Indians. Selected staff members of the White Cloud Center, who have developed active collaboration with the Indian communities, will become project staff through the affiliation between the White Cloud Center and the UOHSC.

The research proposal involves utilization of the Psychiatric Epidemiology Research Interview (PERI). This instrument will be pretested in the Indian communities with a lexicon development of the individual subscales. After cultural sensitization of the PERI, research application will be made to five index and one community subject group. The five index groups include patients from the medical clinic, mental health clinic, law enforcement probation service, alcohol treatment program, traditional Indian medicine men. Special consideration will be given to prevent an overprediction of psychiatric illness from high subscale scores that reflect psychophysiologic distress to physical illness.

The data analysis will provide a description of the epidemiology of the spectrum of depressive reactions in these American Indian cultures with consideration for depressive responses in physical illness, stress reactions, primary psychiatric illness, antisocial behaviors, substance abuse, and special cultural syndromes.

HOMOCYSTINURIA - METHIONINE METABOLISM IN MAMMALS

S.H. Mudd, U.S. Dept. of Health & Human Services, Public Health Service, Alcohol Drug Abuse & Mental Health Admin., National Inst. of Mental Health, Alkaloid Biosynthesis Section, *Bethesda, Maryland* 20014 (Z01 MH 00936-17 LGCB)

A survey of the health status of parents and grandparents of patients with homocystinuria due to cystathionine synthase deficiency has been completed. The aim was to determine whether the mild homocyst(e)inemia present in heterozygotes for this recessively inherited condition are at increased risk for atherosclerotic diseases: heart attacks and strokes. The information upon these relatives was compared to comparable information upon relatives of patients with either impaired phenylalanine metabolism or new mutation achondroplastic dwarfism.

Age-stratified comparison of the incidence of heart attacks and/or strokes failed to reveal significant increases consistently present in relatives of homocystinurics. Life table analyses of cumulative incidence of fatal heart attacks as a function of age likewise revealed no striking differences. No more than 5 percent of heterozygotes will have a coronary attack by age 50. These results indicate that mild homocyst(e)inemia is not an important contributory factor to atherosclerotic disease in the general population and provide no support for current hypotheses which postulate such an association.

STUDY OF CHILDREN AND GRANDCHILDREN OF PATIENTS WITH DEPRESSIVE ILLNESS

L. Cytryn, U.S. Dept. of Health & Human Services, Public Health Service, Alcohol Drug Abuse & Mental Health Admin., National Inst. of Mental Health, Unit on Childhood Mental Illness, *Bethesda, Maryland* 20014 (Z01 MH 00098-06 BP)

It is the long range purpose of this project to determine the frequency of affective disorders in the children of adults with unipolar and bipolar depressive illness, and to identify biological makers of a genetically transmitted predisposition to affective disorders, and to study the interaction between genetic predisposition and environmental factors in children with affective disorders. Our present project is refined replication of our pilot project reported last year. The major changes involve the inclusion of two control groups as well as a blind interviewer and rater.

COLLABORATIVE BIOLOGICAL RESEARCH IN SCHIZOPHRENIA

S.S. Kety, Harvard University, Boston Campus, McLean Hospital, Laboratories for Psychiatric Research, *115 Hill St., Belmont, Massachusetts* 02178 (P01 MH 31154-04)

A multidisciplinary collaborative research effort bringing new knowledge, concepts and techniques from fundamental disciplines to bear on the problem of schizophrenia and other major psychoses. The disciplines represented as major components of the program are neuroanatomy, neuropathology, genetics, neuropharmacology, psychology and clinical investigations. Research in neuroanatomy will continue to examine by anterograde- and retrograde-labelling the position of the monoamine cell groups in the overall organization of the fore- and mid-brain. A novel approach to neuropathology will utilize computer-assisted morphometric techniques for quantitative analysis of dendrite arborizations of neurons. Genetic studies will examine questions of nosology, etiology diversity, genetic and environmental factors utilizing adopted individuals and their relatives, or by the intensive study of families with a high frequency of mental disorder. Pharmacological studies will examine specific behavioral responses of the neuroleptic drugs, their diurnal rhythms, and alterations associated with estrus, pregnancy, development and aging. Psychological studies will examine smooth pursuit and saccadic eye movements, the nature of the cognitive disorder and of information processing in schizophrenic and control populations. Studies with a radioreceptor assay for neuroleptics, therapeutic approaches based on new rationales, and the development of rigorous diagnostic concepts and their epidemiological application will constitute the focus of the clinical research.

EPIDEMIOLOGY OF RECENTLY BEREAVED WOMEN

G.W. Comstock, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (R01 MH 31257-03)

This study has two major purposes: (1) to see if there are adverse physical and mental health effects associated with bereavement of sexagenarians; and (2) to identify factors associated with amelioration or aggravation of these health effects.

A prospective epidemiologic study is proposed of women 65 to 70 years of age; a group at high risk of becoming widowed. They will be interviewed before this event takes place and will be followed for two years after the death of the spouse. The major focus will be to study the health effects of this event, both physical and psychiatric and the factors that may mediate between the event and the effects. Data will be gathered from all of the women in this age group who are still married at the time of interview. Questions will concern health, social support systems, functioning, life satisfaction, and depression. As each woman becomes widowed, she will be matched to three non-widowed women, and they will be followed for a two year period. Each one will be interviewed five times (every 6 months) in addition to the baseline interview. Comparison will be made between the widowed and non-widowed and differences among the widow will be examined.

EPIDEMIOLOGICAL GENETICS AND FAMILY STUDY

T. Reich, Washington University, School of Medicine, Dept. of Psychiatry, *660 S. Euclid Ave., St. Louis, Missouri* 63110 (P50 MH 31302-03)

The major psychiatric disorders are both common and familial. Affected individuals tend to have immediate relatives who suffer the same type of disorder and many generations of a kindred may contain affected individuals. For some illnesses such as schizophrenia and the major affective disorders, there is evidence that both genes and environment are important. Our Center includes theoretical and clinical approaches to understanding this important phenomenon. New methods are being developed for the measurement of early environmental factors and the way in which genetic and environmental factors interact to produce disorders is also being studied. Projects which improve methods for the assessment of early family environment; a study of the genetics of pre-senile and senile Alzheimer's dementia; and several theoretical projects whose goal is the development of new statistical approaches to gene-environment interactions are included. In addition there is a core of essential personnel who offer guidance to other Center members. New Projects are being developed and will be submitted for approval.

An important Center activity is the participation of many professionals from diverse disciplines in an educational and training program. The result has been an exciting, intellectual environment and the creation of new approaches to an age old problem.

AN EPIDEMIOLOGICAL STUDY OF ATYPICAL SCHIZOPHRENIA

M.T. Tsuang, University of Iowa, School of Medicine, Dept. of Psychiatry, *Jessup Hall, Iowa City, Iowa* 52240 (R01 MH 31673-03)

Our purpose is to gather comprehensive epidemiological data on 310 'atypical schizophrenics' in a long term follow-up and family study. Procedures designed in the Iowa 500 Research Project, a study of the major psychoses now nearing completion at University of Iowa Psychiatric Hospital (IPH), give us highly effective methods for tracing and personally interviewing subjects as well as extensive procedures for data management and analysis.

In the Iowa 500 study, we used specified research criteria to select nuclear groups of 200 schizophrenics, 100 manics, and 225 depressives from patients consecutively admitted to IPH between 1934-1944. In the same population, 310 carried a chart diagnosis of schizophrenia but failed to meet the research criteria, chiefly for short duration of symptoms, episodic course, or mixed schizophrenic and affective symptoms. These 310 atypical schizophrenics and their families, plus a stratified random sample of 176 surgical controls and their families comprise the study sample. The control group provides baseline for comparison and maintains blindness in data collection.

Our aim is to identify homogeneous subgroups within the atypical schizophrenics by analyzing all follow-up and family data. We will compare these subgroups with any homogeneous subgroups we identify within the typical groups of schizophrenia and affective disorder. Using all available information we will identify homogeneous subgroups within the major psychoses. Finally, we hope to use the results of our analysis to refine the research criteria for selecting pure subgroups in future biological and psycho-social studies.

CHROMOSOME ABNORMALITY AND BEHAVIORAL VARIATION

S. Walzer, University of Massachusetts, Medical School at Worcester, School of Medicine, Dept. of Psychiatry, *55 Lake Ave. N., Worcester, Massachusetts* 01605 (R01 MH 31897-04)

The research aims of this study are to relate the new areas of cytogenetics and human behavior genetics to problems in normal human development and psychopathology. We are investigating the nature of the relationship which might exist between the sex chromosome aneuploides in males (i.e., XXY, XYY) and subsequent personality development. Infants with these chromosome lesions and infants serving as controls were located through a chromosome screening of male neonates. These infants and children are being followed in a long-term developmental study with the aim of identifying reactive styles or developmental lags that might be related to the chromosome variations. The data, obtained through semistructured parental interviews (recorded verbatim) and direct observations of the child, are reduced to 16 operationally defined categories of behavior that represent the child's development and functioning in the most relevant aspects of psychosocial adaptation. Preliminary conclusions based on the systematic sampling method are tested independently by formal psychological testing and developmental assessments.

Considerable controversy has surrounded the issue of the possible relationship which might exist between certain sex chromosome variations and personality development. This controversy has resulted from the fact that much of the evidence suggesting such a relationship has been obtained by surveying groups of individuals who demonstrated a particular personality deviation and finding an increased incidence of specific chromosomal aneuploidy among them. The natural history of unselected individuals who carry such variations remains largely unknown. Should long-term longitudinal studies of affected individuals reveal any developmental risk associated with the variation, this knowledge can be directed to helping these individuals overcome developmental lags and realize their full developmental potentials.

EPIDEMIOLOGY OF DEPRESSION AND HELP-SEEKING BEHAVIOR

R.R. Frerichs, University of California, Los Angeles Campus, School of Public Health, *405 Hilgard Ave., Los Angeles, California* 90024 (R01 MH 32267-03)

This research consists of an epidemiolgic study of depression and help-seeking behavior among the adult population of Los Angeles County. The major objectives are to provide estimates of the prevalence and incidence of depression, and to identify causal factors and outcomes associated with this condition. The factors examined include: life event stressors, physical health status, health care utilization, medication use, and social support networks.

A sample of 1,000 adults representative of the Los Angeles County population were studied for one year. Four interviews were conducted quarterly, beginning in May, 1979. The interviews were face-to-face for the initial and final waves of data collection, and by telephone for the second and third waves. At the time of the final panel interview (May, 1980) a new control sample of 500 was interviewed to assess the reactiveness of the panel study, and to compare the two interview modes. Due to the large Hispanic community, interviews were conducted in both English and Spanish. The major instrument for classifying depression is the NIMH CES-D scale.

In addition to delineating the causes and consequences of depression, this project studies the role of social support systems on the use of community health services by individuals identified as depressed. The relationship between depression and cigarette smoking, alcohol consumption, and the use of medications were also examined.

ADOLESCENTS AND ADULTS AT GENETIC RISK FOR PSYCHOSIS

E.J. Anthony, Washington University, School of Medicine, Dept. of Psychiatry, *660 S. Euclid Ave., St. Louis, Missouri* 63110 (R01 MH 24819-07)

This present proposal represents the third stage of a prospective longitudinal study of children at high genetic risk for psychosis, during which a majority of the Ss will undergo the further developmental shift into young adult life, having passed through the critical phase of adolescence. As with the previous shift from childhood to adolescence, the transition will necessitate the shift in methodology toward a more adult form of testing. However, the central emphasis will still be on two-pronged approach to the subject, focusing on nonclinical aspects to do with life patterns, life experiences, life competences and inner life, as well as the emerging clinical aspects of problematical behavior and psychopathology, and the methods to be used will explore both areas. the five main objectives of this stage will be 1) to continue the systematic assessments of all the Ss (experimental, physical and normal controls) as they pass their respective age-gates; 2) to continue the analysis of cross-sectional differences between the various subject groups while paying special attention to the paths being followed through development; 3) to examine more fully the nature and nurture of vulnerable and resilient Ss (diagnosed as such in the furst research state) in relation to nonclinical and clinical outcomes; 4) to monitor closely the 'natural history' of the breakdown process, comparing initial with subsequent decompensations and earlier antecedents; 5) to examine in much greater detail our unique sample of offspring at high genetic risk for Manic Depression. The overall objective is still to relate the psychological and social development of the offspring to the nature and severity of the parental illness together with the degree of pathology in the nonproband parent.

NIMH COLLABORATIVE PSYCHOBIOLOGY DEPRESSION PROGRAM

M.B. Keller, Massachusetts General Hospital, Psychiatry Service, *32 Fruit St., Boston, Massachusetts* 02114 (R12 MH 25478-07)

The overall purpose of the NIMH-CRB Program is to investigate clinical, genetic, biological and psychosocial aspects of the nature and etiology of depression

and the affective disorders. The proposed investigation will employ clinical psychopathological and genetic-familial methods in a sample of over 1,000 patients overall in the collaborative projects.

The grant proposes two major sets of studies--clinical psychopathology and genetic and family studies. The basic hypotheses common to these studies is that the affective disorders are heterogeneous as regards etiology, clinical features and response to treatment. Precisely defined homogeneous nosological classes validated by multiple external correlates will facilitate identification of risk factors for epidemiological studies and verification of hypotheses as to etiology and pathogenesis.

Goals set for this current year of the study include recruitment of subjects into the study, 6 month, 12 month, 18 month and 24 month follow-up evaluations of patients already included, continued coordination of the follow-up phase for the entire study, and preliminary analyses of the 6 month, 12 month and 18 month follow-up data.

HOSPITALIZED MENTAL DISORDER IN QUEBEC & ISRAEL

J. Lasry, Jewish General Hospital, *3755 Cote St. Catherine Rd., Montreal, Quebec, Canada* H3T 1E2 (R01 MH 32430-01S1)

This cross national research concerns ethnic and class stratification and rates of first psychiatric hospitalization. Both Israel and Quebec are excellent examples of multicultural societies where ethnic stratification can be well-studied. Several Jewish ethnic groups in Israel are present in sizable populations in Quebec. This research situation allows exploration of several issues: (1) the effect of ethnic disadvantage on rate of schizophrenia, holding social class constant; (2) the relationship of immigration to rate of schizophrenia; (3) the suggested differences in rates of affective psychosis between Ashkenazic and Sephardic Jews.

As well, results reported frequently in the United States will be replicated in these two foreign settings, and other issues will be explored.

Data on first psychiatric hospitalization in the Montreal area in 1976 will be collected by examining the records of all hospitals admitting psychiatric patients. Similar data have already been collected for Israel for 1972. The data are classified in identical fashion and virtually 100% complete in Israel and Quebec. The census of Canada and Israel will be used for denominators.

ANOREXIA NERVOSA - PREVALENCE, DETERMINANTS, TREATMENT

P.E. Garfinkel, Clarke Inst. of Psychiatry, *250 College St., Toronto, Ontario, Canada* Zone 2B (R01 MH 32659-02)

A major problem in identifying cases of anorexia nervosa in the non-clinical population has been the lack of a well-validated, reliable instrument to measure the symptoms of the disorder. We began this area of our investigations by constructing and validating a 40 item test, the Eating Attitudes Test (EAT).

Following construction of the EAT, we administered this test to 5 groups of individuals (N equals 423). These included ballet students (N equals 183), fashion students (N equals 56), and control groups of university students (N equals 81) and music students (N equals 35) as well as patients with anorexia nervosa (N equals 68). This study was conducted in order to determine if sociocultural pressures to be thin, as exemplified by women who by career choice must focus increased attention on body size, would result in an increase in anorexia nervosa. We found anorexia nervosa to be more common in dance and modelling students than in other women of a similar age and social class. The prevalence of 7% in these groups using rigorous diagnostic criteria is higher than in a preliminary report (Garner and Garfinkel, 1978) and supports the hypothesis that individuals who must focus increased attention to a slim body are at risk for anorexia nervosa. It may also be that girls who are attracted to dance in the first place (because of a drive for activity, for example) are those predisposed to anorexia nervosa. Alternatively dance's preoccupation with the body, self-control and perfection may be important factors needed to bring out the disorder, rather than just slimness demands. This is supported by the finding that within the dance sample there was a higher risk for anorexia nervosa in those programmes in which there was greater pressure to succeed as a professional. In these groups, all cases of anorexia nervosa developed after students began to study dance. The high incidence of anorexia nervosa in the more competitive schools documents the merit of future attempts to measure more directy the role of perceived performance expectation in individual students to determine its relationship to the development of the disorder.

There has, to date, been no estimate of the prevalence of anorexia nervosa in North America and the European studies of this are only those of Crisp and Nylander. (Text Truncated - Exceeds Capacity)

SEXUAL ASSAULT OF PROSTITUTES

M.H. Silbert, Delancey Street Foundation Inc., *2563 Divisadero St., San Francisco, California* 94115 (R01 MH 32782-02)

This proposal is designed to document the prevalence, descriptive factors, and impact of sexual assault among prostitutes, and to provide and evaluate intervention services for prostitutes to treat and control sexual assult.

The proposal is designed in two phases. The first phase will document the prevalence and descriptive factors of rape since becoming prostitutes, and the prevalence and descriptive factors of juvenile sexual exploitation prior to becoming prostitutes of 100 adult and 100 juvenile prostitutes; and will determine the needs for intervention services for prostitute victims of sexual assault.

The second phase will implement these intervention services for juvenile and adult prostitute victims of sexual assault, and will evaluate the services provided. During the process evaluation of these services, the impact of rape and juvenile sexual exploitation on prostitutes (30 adult, 30 juvenile) will be explored in depth.

3.0268,
THE THREE MILE ISLAND ACCIDENT - PSYCHIATRIC SEQUELAE

E.J. Bromet, University of Pittsburgh, School of Medicine, Dept. of Psychiatry/Epidemiology, *3550 Terrace St., Pittsburgh, Pennsylvania* 15261 (R01 MH 35425-01)

The purpose of this study is to assess the long-term mental health effects of nuclear incident at Three Mile Island (TMI). Unlike previously studied disasters, the incident threatened to destroy an entire region, and the ultimate outcome remains highly ambiguous. In light of the persistent danger and unusal stress caused by the incident, the psychological well-being of the TMI resident is a major public health concern.

The proposed study is an expansion of an existing epidemiological investigation of the mental health of three groups thought to have been particularly affected by the stress of TMI: mothers of preschool children living within 10 miles of the plant; mental health system clients living within 10 miles of the plant; and workers at the nuclear power plant. These groups were interviewed twice, 9 months and 1 year after the event. The proposed study will assess the long-term mental health effects of the incident by reinterviewing these cohorts at the second, third, and fourth anniversaries of the incident. Two comparison groups will be included, similar residents living near another nuclear power facility in Pennsylvania (who participated in the original study), and similar residents living near a non-nuclear electric generating plant. In addition to assessing mental health with standardized instruments, the role of social networks in modifying the impact of stress over time will be investigated. If another catastrophe occurs at TMI during the course of the study, the samples would be reinterviewed as soon as possible.

THE MIDTOWN MANHATTAN LONGITUDINAL STUDY:

B.J. Gurland, Columbia University, College of Physicians & Surgeons, Dept. of Psychiatry, *630 W. 168th St., New York, New York* 10032 (R01 MH 32794-02)

This twenty year follow-up investigation of a panel originally age 20-59 focusses on a series of life outcomes that include indicators of physical, mental, and social well-being and their changes over two decades, primarily among age, gender and generation-separated cohorts, controlling primarily for changes in labor force, socioeconomic and marital status. A central emphasis is discernment of resilience-vulnerability to psychopathology under impact of pre-1954 and post-1954 contextual changes.

STUDIES OF PERSONS AT RISK FOR DEPRESSIVE DISORDERS

R.A. Depue, State University of New York, Buffalo Campus, School of Social Science & Admin., Dept. of Psychology, *3435 Main St., Buffalo, New York* 14214 (R01 MH 33083-01)

The objective of the research proposed within is to study subsyndromal depressive individuals who are at increased risk for developing major forms of depressive disorders. Three lines of research, each aimed at assessing different aspects of the risk population, are described separately but will be undertaken concurrently, where subjects are assessed on multiple measures.

Because no economical procedure is currently available to identify subjects at risk for depressive disorders, the first line of research concerns the evaluation of a first-stage case identification inventory (the General Behavior Inventory, GBI). The GBI is a self-report inventory that assesses the core behavioral characteristics of subsyndromal disorders. To proceed with its evaluation, major validation and calibration studies of the GBI are presented. These studies involve the administration of the GBI to full syndromal depressives in remission, outpatient subsyndromal cases, and outpatient personality disorder controls (RDC diagnosed). Moreover, high and low GBI scorers from the 'normal' population will be interviewed 'blind' for 'caseness' and family history, and rated on the GBI by the interviewer.

The second line of research examines a hormonal variable that may serve as a peripheral index of central predisposition to full syndromal depressive disorder. Plasma free cortisol values are assessed repeatedly (catheterization procedure) in subsyndromal and normal subjects during a 3-hour protocol. The protocol evaluates the integrity of the central inhibitory modulation of ACTH-cortisol release during rest, math-distracting noise-time pressure stress, and recovery of cortisol values.

The third line of research is aimed at exploring the defining characteristics of subsyndromal disorders and at developing an index of severity of behavioral dysfunction. The studies evaluate behavioral variation in subsyndromal and normal subjects by having all subjects rate their behavior and personal events daily for 28 consecutive days. Analyses focus on the nature of behavioral variation and its relation to stress-initiation and cortisol dysfunction.

These three lines of research will provide the empirical foundation for a prospective study of subsyndromal individuals to be initiated in the near future.

MEASURES OF UNTREATED PSYCHIATRIC DISORDER

B.P. Dohrenwend, Columbia University, College of Physicians & Surgeons, Dept. of Psychiatry, *630 W. 168th St., New York, New York* 10032 (R01 MH 10328-16)

This research focuses on the central unsolved problem of psychiatric epidemiology, the probem of how to measure psychiatric disorders independently of treatment status in the general population. Its major aim is to test the sensitivity and specificity of the newly developed Psychiatric Epidemiology Research Interview (PERI) as a first-stage instrument to screen functional psychiatric disorders among adults in a demographically complex urban population.

To this end, we will investigate PERI's relationship to other potential screening instruments on a sample of 600 adults from the general population and calibrate PERI on a sample of 500 psychiatric patients with DSM-III diagnoses of schizophrenia and the schizophreniform psychoses, affective disorders, various types of disorder under the heading of neurosis, antisocial personality, and other selected personality disorders.

The research setting is Washington Heights, a section of Manhattan in New York City that surrounds Columbia Presbyterian Medical Center. It is a demographically complex urban area containing large percentages of blacks and Puerto Ricans as well as members of more advantaged ethnic groups.

The results should provide a major step toward the development and testing of a two-stage procedure for case identification and classification. The findings should also be important for needs assessment and for the planning and evaluation of mental health services in Washington Heights.

CHILDREN AND FAMILIES VULNERABLE TO MENTAL DISORDERS

L.C. Wynne, University of Rochester, School of Medicine & Dentistry, Dept. of Psychiatry, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (R01 MH 22836-09)

The major overall objective of this program is to study families with children believed to have varying degrees of risk for later mental disorder as well as for intermediate outcomes (assessed in terms of degrees of competence versus psychiatric dysfunction). Risk for dysfunction in these children is based upon the diagnosis of a serious mental disorder that has required hospitalization in at least one parent; alternative risk indices based upon deviant family communication patterns also are being studied and can be compared with parental diagnosis as a risk variable. The vulnerability of the children was assessed during the initial evaluations with psychophysiologic measures, psychological tests, and clinical studies, both current and historical.

During the past year, 34 families participated (or are now involved in) our 3-year followup. This brings the total followup to 94 families as of 9/1/79. Five additional families who had move out of town were located and have agreed to participate in any feasible manner. Thus far 88 percent of the 113 families contacted have agreed to participate in the followup.

During the coming year, analysis of data from the initial evaluation and the completion of followup data collection will occupy major attention in this program. Analysis and interpretation of data across substudies are now of special interest. For example, study of the relationship between diagnostic data about the parents will be compared with family interaction measures as predictors of school performance, child psychophysiologic indices, and psychological test measures of the children.

MENTAL ILLNESS IN ENGLAND

R. Neugebauer, Columbia University, Graduate School of Arts & Sciences, Dept. of History, *Broadway & W. 116th St., New York, New York* 10027 (R03 MH 35850-01)

The proposed investigation has a set of substantive and methodological goals. Substantively, it is a study of the incidence of certified cases of psychiatric disorder in 16th and 17th century England. The records of legal incompetency hearings constitute the major documentary basis of this project. These records, representing referrals to the Court of Wards and Liveries, (1540-1660), the only national institution in pre-industrial England concerned with the protection of the mentally ill, permit an analysis of fluctuations in the size, social class, sex, age, geographic and diagnostic composition of cases of possible and of certified psychiatric disorder over a hundred-year period. The contributions of institutional, political and socioeconomic factors to these fluctuations will be examined. Suggestive estimates of rates of psychiatric disorder among English landowners in specific counties will also be attempted. In addition, the reports of insanity hearings will provide some information regarding the theories held by the examining commissioners and the jury regarding the etiology of psychiatric disorder, while information on the persons making referrals will provide insight into social and familial responses to deviant behavior.

Methodologically, the study aims to assess the value of a biostatistical technique of estimating the size of an original historical population based on extant incomplete lists of population members. The technique, while widely used in work on animal censuses and in some epidemiological investigations, is almost unknown in historical epidemiology and medical and social history.

THE EPIDEMIOLOGY AND DYNAMICS OF ADOLESCENT LONELINESS

T. Brennan, Inst. for Research on Social Problems, *520 Pearl St., Boulder, Colorado* 80302 (R01 MH 35961-01)

This is a study of the epidemiology and etiology of adolescent loneliness in a national sample of youth. The descriptive objectives include: (1) examining the multidimensionality of loneliness as experienced by American youth so as to establish the multidimensionality of loneliness as experienced by American youth so as to establish the nature and meaning of this experience; (2) establishing the incidence of particular forms or dimensions of loneliness, both for the general adolescent population and for specific age, sex, class, and ethnic subpopulations; (3) describing patterns for change in the degree and form of loneliness across time for different age, class, race, and sex groups; and (4) describing the form and frequency of certain responses to loneliness.

The explanatory objectives involve a test of a general theorectical model specifying precipitation and predisposing factors in the emergence of loneliness. Basically, loneliness is viewed as the result of (1) weak or attenuated internal bonds; (2) weak or attenuated external bonds (deficits in social relationships); and (3) precipitating factors associated with developmental changes experienced during adolescence.

The data include three national surveys with a youth panel (N equals 17349) completed in 1977, 1978, and 1979. Planned analyses include a number of multivariate taxonomic methods, comparative factor analyses, multiple regression, and age-cohort analyses employing t-tests and ANOVA techniques.

AGGRESSION AND PSYCHOPATHOLOGY - A 20 YEAR FOLLOW-UP

L.D. Eron, University of Illinois, Chicago Circle Campus, School of Liberal Arts & Sciences, Dept. of Psychology, *601 S. Morgan St., Chicago, Illinois* 60680 (R01 MH 34410-01)

This is the third phase of a longitudinal study of the psychosocial development of aggressive behavior. Subjects first seen in 1960 included the entire third grade population (N equals 875) of a semi-rural county in New York State. They were seen in the classroom for a series of group tests and questionnaires. Personal interviews were conducted with 85% of their mothers and 71% of their fathers to determine learning conditions in the home which would relate to aggression of children in school as rated by peers. In 1970 interviews were held with 427 of the original subjects; peer ratings were repeated and, along with other measures, self-ratings of aggressive behavior and the MMPI were administered. Arrest records and state hospital admissions statistics were also employed. Among the best predictors to aggression after 10 years were violence of preferred television programs at age eight, social mobility orientation of parents, and evidence of the internalization of society's standard of behavior. Findings have been reported extensively. A third phase is now planned in which it is expected that 300 of the original subjects will be reinterviewed as well as their spouses and any children they might have between ages six and ten. Arrest data and state hospital data will again be sought. Measures of psychopathology as well as interpersonal skills, vocational, intellectual and social competence and television habits will be related to past and current aggression and early socialization data. Longitudinal data from the three different phases will be analyzed to test causal hypotheses. Intergenerational effects will be of interest.

PATTERNS OF DIFFERENTIAL RESPONSIVENESS TO STRESS

R.C. Kessler, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Sociology, *Ann Arbor, Michigan* 48104 (R01 MH 34479-01)

While most stress researchers would agree that stress-provoking life crises and chronic stressful life situations both can lead to feelings of psychological distress, we know that even the most sophisticated scales of stressful events or situations explain only small percentages of observed variance in subjective mental health in community samples. For some time now it has been known that this predictive power could be increased substantially by taking into consideration individual differences in responsiveness to stress; that is, by recognizing that some people are much more vulnerable than others the emotional damage that can result from a stressful experience. However, we do not yet understand the underlying dynamics of these individual differences.

The proposed work seeks to investigate patterns of differential responsiveness to stress empirically, as a way of increasing our understanding of these dynamics. This is to be done by studying a variety of existing epidemiological data sets across a consistent set of sociodemographic contrasts. Detailed study of differential responsiveness patterns across these contrasts and across a number of different stress domains will be followed by hypothesis testing aimed at differentiating contending interpretations of the patterns observed.

STRESS, ILLNESS, AND COPING IN A RURAL CONNECTICUT TOWN

R.C. Ness, University of Connecticut, Health Center, School of Medicine, Dept. of Psychiatry, *Farmington Ave., Farmington, Connecticut* 06032 (R01 MH 34543-01)

Our primary objective is to ascertain the levels, prevalence and disposition of psychiatric disorder and emotional distress in a small, rural community, and examine their relationship to three variables which have been implicated in the epidemiological literature as being linked to psychiatric disorder: social stress, social support and personality. We are assessing present and past levels of disorder in our study sample through the use of the NIMH Diagnostic Interview Schedule (DIS). Social stress is being measured through: (1) the assessment of the stress of social role performance, and (2) the tabulation of recent life change events. Social support is being measured by a social network assessment instrument, the Pattison Psychsocial Kinship Inventory. Personality is being assessed by two objective tests: (1) the Personality Research Form and (2) the Jackson Personality Inventory. Information about disposition of and coping with disorder will be derived from open-ended case history interviews and interviews with key informants.

GENDER DIFFERENCES IN SICK-ROLE BEHAVIOR

C.L. Huffine, Inst. for Research in Social Behavior, *456 22nd St., Broadway Grand Plaza, Oakland, California* 94612 (R03 MH 34564-01)

The purpose of this study is to examine social stress and sex-role socialization as related to gender differ-

ences in sick-role behavior. As a point of departure we propose to synthesize two approaches prominently used to explain gender differences. One approach emphasizes differential stress associated with male and female roles in explaining gender differnces in rates of illness; the other emphasizes traditional differences associated with the socialization of men and women as the basis for explaining gender differences in reporting illness and in seeking health care. Analyses will be based on interview data collected in three large household surveys conducted between 1967 and 1971. The last was a national survey and all were probability samples. All three surveys included questions about stress and emotional distress, as well as use of medically prescribed medications, alcohol, and other modes of coping with distress. The work is expected to enhance our understanding of sick-role behavior and provide a firm basis for analyzing and interpreting data currently being collected in a second national survey.

TIME SERIES ANALYSIS OF TREATED BEHAVIORAL DISORDER

C.D. Dooley, University of California, Irvine Campus, Public Policy Research Org., Dept. of Social Ecology, *Irvine, California* 92664 (R01 MH 34578-01)

A time series approach will be taken to treated mental disorder with the only comprehensive case register in the United States, the Monroe County Register of New York State. The epidemiology of psychiatric admissions will be studied in a way which clarifies the contributions of trends, seasonal cycles, and community variables such as economic and demographic change. Monthly admission counts will be generated for the 11 years from 1962 through 1972 for first and later admissions, public and private providers, in and outpatient treatment, and age, sex, and social status groups. In addition, suicide, economic, and other community monthly time series will be obtained. Time series analyses (including Box-Jenkins and other methods) will be used to address several questions regarding the relative contributions of predictors to admissions, the relationship of admissions and suicides, the relationship of different admissions series (e.g., public vs. private), the relationship of economic variables to admissions between demographic groups, and the relative importance of community predictors with and without detrending and deseasonalizing.

FAMILY STUDY OF AGORAPHOBIA AND PANIC DISORDER

R. Noyes, University of Iowa, School of Medicine, Dept. of Psychiatry, *Jessup Hall, Iowa City, Iowa* 52240 (R03 MH 34645-01)

The proposed research will compare the prevalence of various psychiatric disorders among the relatives of patients with agoraphobia and with panic disorder. For purposes of this comparison all available first-degree relatives of a group of approximately 20 agoraphobic and 20 panic disorder patients that have been matched for age and sex will be personally interviewed by a research assistant according to a structured format. DSM-III diagnoses will then be established by two psychiatrists through independent and blind review of data from interviews. Where relatives are unavailable for interviews, information from remaining relatives will be pooled for diagnostic purposes. Because the size of the sample for this project is limited the results will be preliminary in nature. They should, however, further the comparison of psychiatric illness patterns among agoraphobic and panic disorder relatives and lead, eventually, to a determination of whether these are separate illnesses or a single disorder.

CHILDREN AT RISK FOR AFFECTIVE DISORDERS

W. Beardslee, Harvard University, Boston Campus, Massachusetts General Hospital, *32 Fruit St., Boston, Massachusetts* 02114 (R01 MH 34780-01)

OBJECTIVES: 1) to determine the correlations of different types and severity of depressive illness in parents and the characteristics of their children at different stages of development; 2) to identify psychosocial and genetic factors which either exacerbate or mitigate the deleterious effects of growing up with a psychiatrically ill parent; 3) to identify psychiatric symptoms and syndromes and adaptational difficulties in children which may be early indicators that a child may go on to develop an affective disorder; 4) to identify neuropsychological abnormalities in children which may be precursors of later psychiatric disorder; 5) to assess the frequency of affective disorder, other psychiatric disorders, and adjustment difficulties and to carefully describe such clinical manifestations in a group of children whose parents have been carefully assessed and found to be suffering from affective disorders; 6) to assess the impact of life events on the coping skills of children at high risk for affective disorders; 7) to identify a cohort of children that will be particularly suitable for longitudinal follow-up; 8) to design, on the basis of our initial findings, models of intervention that can subsequently be tested.

Additional information gained through the proposed study will be: 1) a clinical analysis of the types of problems experienced and demonstrated by children at different stages of development and in different life circumstances; 2) the relationship of certain types of affective illness in the parents to possible specific syndromes in the children; 3) the relative strength of genetic versus environmental factors in the production of later illness.

Finally, the data gathered by the proposed study can be used as a basis for a long term follow-up study documenting the possible precursors, onset and course of affective disorders as well as shedding new light on the developmental origins of later personality structure.

EPIDEMIOLOGICAL SCALES - WELL-BEING VS. DEPRESSION

T.F. Rogers, Columbia University, Graduate School of Business, *Broadway & W. 116th St., New York, New York* 10027 (R01 MH 35310-01)

To date, scant attention has been paid to the possible overlap between sociological efforts to measure the quality of life or well-being of the public and epidemiological efforts to measure public mental health. Sociological measures of the quality of life were developed in response to problems perceived with the fixed-answer scale developed to measure depression, anxiety, or other psychological disturbances. The initial questions devised to measure life satisfaction resulted in responses heavily concentrated on the most favorable answers, but cumulative research by sociologists has resulted in scales that succeed in eliciting a wider range of answers. Despite criticism even within the field of mental health, the use of brief psychological scales has continued because of the tremendous economies in time, money and research effort. The constant development of new scales of this sort has been attended by much discussion about what they really measure. The analysis we propose would address the similarities and differences of two scales currently in widespread use, one developed to measure depression in the general population and the other to measure overall well-being and satisfaction with various domains of life. The data to be used for this analysis come from two telephone surveys: one of 700 women who experienced a particularly stressful health crisis ad the second, a sample of comparable women from the general population. The proposed research will analyze the correlation of two scales for both populations for individual items and across various demographic sub-groups. Validity of the scales will be tested by investigating their consistency with other measures of depression, recovery and normal life functioning among study respondents. In addition, possible effects on scale responses from telephone interviewing will be investigated.

EPIDEMIOLOGY OF SCHIZOPHRENIA IN CROATIANS

E.F. Torrey, U.S. Dept. of Health & Human Services, Public Health Service, Alcohol Drug Abuse & Mental Health Admin., National Inst. of Mental Health, Noyes Division, *2700 Martin Luther King Ave., c/o St. Elizabeths Hospital, Washington, District of Columbia* 20032 (R03 MH 34159-01)

A unique data base exists which may shed light on the relative importance of genetic versus environmental causes of schizophrenia. Studies over the last decade have proven that the northwestern corner of Croatia has a high schizophrenia and manic depressive psychosis prevalence rate. Immigrants from this part of Croatia settled in northern Minnesota.

Using Minnesota State Hospital records, it is proposed to ascertain the schizophrenia and manic depressive prevalence rates for both first and second generation Croatian immigrants. This will be compared with the rates for other immigrant groups in Minnesota and with native-born Americans. Since the town of origin of the immigrants is available through insurance records, the immigrants from the high prevalence Croatian area can be compared with those from the rest of Croatia. Furthermore a case register exists in Zagreb for all of Croatia, enabling contemporary comparisons to be made between immigrants and those who remained behind in specific areas of Croatia. The possible importance of age of immigration can also be examined.

The research should yield important data for analyzing various etiological theories of schizophrenia.

FAMILY SUPPORTS AMONG HEALTH-THREATENED WORKERS

P. Lowinger, Western Inst. for Occupational & Environmental Sciences, *2001 Dwight Way, Berkeley, California* 94704 (R01 MH 34168-01)

When a family member is threatened by the possibility of a serious illness, emotional effects extend deeply into family life. Other primary group members and family relationships may also be severely threatened. Supportive relationships among family members may not be forthcoming at this time of personal and family stress--the very time when they are needed most. This study has two main purposes: to learn more about the effects of health threats on family life; and to determine the effectiveness of

family support in reducing morbidity among a population exposed to a serious disease agent.

Study subjects will be selected from a group of shipyard and longshore workers exposed to asbestos, which causes severe pulmonary disorders and is a known carcinogen. A sample of 1075 workers who were screened in 1978 for asbestos-related disease will be questioned about the effects of this health threat on family life. Data will be obtained in the following areas: family supportiveness and family competency; predispositions toward the handling of crisis; family and personal responses to the knowledge of exposure to a potentially life-threatening illness. Additional data on control variables will be collected, including: refinement of measures of asbestos exposure; exposure to other job related noxious substances; personal health habits; overall health status. X-ray readings will be used as measures of morbidity.

History of supportiveness among family members and psychological predispositions of the workers toward crisis are expected to relate to the responses families make to the asbestos health threat. Supportiveness of family is also expected to be a significant factor in reducing morbidity among the exposed workers.

APPLICATIONS OF PHARMACOKINETICS IN CLINICAL PSYCHIATRY

R.I. Shader, Tufts University, Boston Campus, School of Medicine, Dept. of Psychiatry, *136 Harrison Ave., Boston, Massachusetts* 02111 (R01 MH 34223-02)

Stated briefly, our objectives are as follows: a) to investigate changes in drug metabolism associated with the aging process by delineating the relative importance and interrelationships of selected pathways (e.g., dealkylation, hydroxylation, glucuronidation) in older persons taking specific (model) benzodiazepines selected to illuminate each pathway. Younger adults will be studied for comparative purposes; b) to determine blood levels for benzodiazepines in patients receiving emergency room care for benzodiazepine overdosage; to assess the relationship between blood levels and morbidity; and to evaluate the usefulness of these levels for clinical care and treatment planning; c) to continue our studies of drug interactions; d) to investigate the development of tolerance (physiological) to benzodiazepines by studying changing threshholds to amobarbital-induced bilateral gaze nystagmus in subjects taking benzodiazepines for varying amounts of time; e) to continue to improve the practicing clinician's understanding of rational therapeutic approaches by extending our educational efforts in clinical psychopharmacology.

SURVEY OF CLIENTS SERVED IN COMMUNITY MENTAL HEALTH CENTERS - SECOND YEAR IMPLEMENTATION

Unknown, Abt Associates Inc., *55 Wheeler St., Cambridge, Massachusetts* 02138

The Community Mental Health Center (CMHC) program of the National Institute of Mental Health (NIMH) (created in 1963 by PL 88-164) has sponsored the development of some 650 CMHCs in the United States. Centers funded under PL 94-63 are required to provide 12 essential services (including inpatient, outpatient, partial care, emergency, and consultation and education services) to a defined catchment area. The extent to which CMHCs meet their mandated NIMH objectives is an appropriate area for evaluation for individual CMHCs and for the Federal program. Part of the evaluation process involves the use of Inventory of Comprehensive Community Mental Health Centers (ADM 25-3) which is a statistical document required of federally funded CMHCs and submitted annually to the Division of Biometry and Epidemiology (DBE). It gathers data on the CMHCs and their clients, including facility information on organizational components, staffing, funding, expenditures, staff hours devoted to consultation and education activities and aggregate client data by race, sex, age and diagnosis. However, the need exists for a 'comprehensive information base for program description' including a client-based survey. The objective of this contract is to refine the design of the survey of clients in CMHCs and to implement the survey in 32 additional CMHCs. Specific Requirements: Task I - Develop a management plan to implement the survey methods and procedures previously developed. 1. Data items to be collected on admissions, terminations, and on services delivered. 2. Definitions of CMHC, CMHC unit, CMHC patient, CMHC admission, CMHC termination, episode, and other related terms. Task II - Induct the study sample. Task III - Operation and management of the survey.

PROFILE - BLACK MALES AT RISK TO LOW LIFE EXPECTANCY

R.E. Dennis, Meharry Medical College, School of Medicine, Dept. of Psychiatry, *1005 18th Ave. N., Nashville, Tennessee* 37208 (R01 MH 26702-05)

The aim of this project is to create a psychological and social profile of three groups of young (ages 18 to 35) black men believed to be at risk to low life expectancy: a sample of 200 men drawn from a random sample of the general household population in majority black urban areas of Nashville, Tennessee and a sample of 150 felons convicted of homicide and interviewed while incarcerated. A social survey questionnaire and battery of selected psychological tests will be administered and the results assessed in light of mortality and morbidity trends for young men of this ethnic group. Those trends suggest that life expectancy already now, has in the most recent decade been on the decline, largely due to increases in violent deaths--accidents, homicides, and suicides. A panel of policy makers is to assist in the formulation of intervention strategies based on research findings, and aimed at increasing the life expectancy and quality of life for young black men.

PHYSICAL VIOLENCE IN AMERICAN FAMILIES

M.A. Straus, University System of New Hampshire, University of New Hampshire, School of Liberal Arts, Dept. of Sociology & Anthropology, *Durham, New Hampshire* 03824 (R01 MH 27557-05)

Continued analysis of data on a nationally representative sample of 2,143 families is proposed. Work to date has provided the most accurate (and in some cases the only) incidence rate statistics on physical violence between family members, including, child-abuse, wife-beating, husband-baating, violence by children toward each other, and violence by children towards parents. Further analysis is needed because the work to date has been largely descriptive analyses of incidence data and analysis of two-variable relationships, and because a number of important issues are still to be investigated. Eleven needed analyses are described. Examples of the questions which these are designed to answer are: (1) What is the relationship between the balance of power between husband and wife and the use of physical violence? How is this affected by such factors as the social class of the couple, and the degree to which the wife is economically independent of the husband? (2) What accounts for group differences in rates of family violence? Among the group differences to be studied (because work to date shows important differences) are the region of the country, socioeconomic status, and race. (3) Is involvement in a primary group community of friends and kin associated with a lower level of family violence, and why? (4) We have found a strong relationship between growing up in a violent family and being violent to one's spouse and children. What about those who do not follow this pattern? Do they have family patterns which will suggest ways to break the generation to generation cycle of violence? The importance of finding answers to questions such as these stems from the extremely high violence rates demonstrated by this project. This adversely affects the quality of family life and is part of the explanation to the high level of violence in the society. There is clearly a need for continued research which can suggest policies to reduce family violence.

EPIDEMIOLOGIC STUDY OF BEHAVIOR PROBLEMS IN CHILDREN

F.J. Earls, Childrens Hospital Medical Center, Dept. of Psychiatry, *300 Longwood Ave., Boston, Massachusetts* 02115 (R01 MH 28266-04)

Three objectives define this total population study of behavior problems in preschool children. The first objective is to determine the prevalence of behavior problems in 3-year-old children; the second, to examine the stability and change of behavior problems from the preschool age to school age; and the third, to investigate the origins of behavior problems, in children under the age of 3 years. The sample is drawn from a register of families with preschool children in permanent residence on Martha's Vineyard Island, Massachusetts.

A prevalence study, conducted in 1978-79, selected 14% of the total population of 3-year-olds to have a behavior problem. Initial emphasis was placed on the validity of the methods used to identify children with behavior problems. Currently, a variety of home environment and temperamental characteristics of the children are being correlated with behavior problems. A follow-up of these same children is scheduled for 1981-83, as they complete first grade. At the same time a longitudinal study beginning in infancy is beginning to investigate the roles of family stress and infant temperament in the origins of behavior problems.

GENETIC STUDIES OF DEPRESSIVE DISORDERS

M.M. Weissman, Yale University, School of Medicine, Dept. of Psychiatry, *333 Cedar St., New Haven, Connecticut* 06510 (R01 MH 28274-05)

Based on a collaborative proposal between the Yale University Departments of Psychiatry and Human Genetics, and the National Institute of Mental Health, Adult Psychiatry Branch, Psychogenetics Unit, in May, 1976 we were awarded a five-year grant (to be completed July 31, 1981) to conduct a family-genetic study using epidemiologic techniques.

All interviewing of probands and relatives has been completed and in the fifth year of this proposal, we expect to: (1) complete diagnosing all first and second degree relatives on the basis of all available information, i.e., including information obtained from the interviews and medical records, and information gathered by family history. (These are the best estimate of diagnosis necessary for genetic analyses.); (2) complete setting up SAS files that will contain all the data which have been collected; (3) prepare summary files which include data collected both at Yale and NIMH; (4) conduct studies to evaluate the reliability of the Family History Method, and the Best Estimate Diagnosis; (5) conduct test-retest reliability studies of the K-SADS-E, the diagnostic interview for children of probands under the age of 18; (6) continue the biological and linkage studies; (7) complete programming for genetic analyses according to several new models recently developed; (8) continue theoretical and evaluative studies on variety of genetic models; (9) start clinical, epidemiological, and genetic analysis.

We are applying for a three-year competitive renewal which will include the complex data analyses for this project and the write-up of our findings.

ASSESSING SITUATIONAL FACTORS IN VIOLENT BEHAVIOR

H.J. Steadman, State Dept. of Mental Hygiene, Special Projects Research Unit, *44 Holland Ave., Albany, New York* 12208 (R01 MH 28850-04)

The main objectives of this research are to: (1) develop, via self-reports, the relative rates of violence among former mental patients, ex-offenders, and the general population; (2) identify the situational factors surrounding such violence; (3) examine differences in the effect of situational and other variables on violence among ex-patients, ex-offenders and the general population; and (4) assess the utility of an impression management theoretical framework in understanding which situational factors may impact upon violence and aggression. Ultimately, this research will contribute to both the substantive knowledge of violence and aggression and the more appropriate use of predictions of violence in a variety of mental health and criminal justice settings.

3.0295,

A STUDY OF AFFECTIVE DISORDERS AMONG OLD ORDER AMISH

J.A. Egeland, University of Miami, School of Medicine, Dept. of Psychiatry, *1400 N.W. 10th Ave., Box 520875, Coral Gables, Florida* 33152 (R01 MH 28287-04)

The objective of this research is to study selected etiologic questions about the bipolar and unipolar forms of affective disorder. The Old Order Amish population serves as an ideal type of human laboratory to determine homogeneous sub-samples of types of affective disorder and for establishing heritability. The Project is studying data from multigenerational pedigrees with large sibships of confirmed bipolar and unipolar probands. Clinical work will seek linkage with a variety of marker traits (biochemical and hematological parameters) and these data will be subjected to linkage analysis. Also, pedigree analysis will be done to test hypotheses regarding the mode of genetic inheritance. Another objective of the research is to consider selected behavioral and environmental factors in the pathogenesis of affective disorders. Affectively disturbed individuals and their unaffected relatives will be compared according to demographic, behavioral and symptomatic data. These putative factors will be examined to question why the illness is manifest in given individuals who may share a common genetic predisposition with other well relations. A sub-study will deal with all known suicides in terms of the absence or presence of: a) a diagnosis of affective disorder; b) a positive family history among first and second degree relatives; and c) the impact of selected cultural and psychogenic factors. The long-term goal of these various objectives is to clarify questions about the causation (etiology) and classification (diagnosis) of affective disorder.

3.0296,

STRESS AND PERSONALITY INTERACTIONS IN HEALTH/ILLNESS

S.R. Maddi, University of Chicago, Graduate School, Dept. of Behavioral Sciences, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (R01 MH 28839-04)

This renewal application is for an extension of the original study. In the original study, hypotheses were confirmed that hardiness (comprised of the personality variables of commitment, challenge, and control) interacts with stressful life-events such that it decreases their tendency to produce subsequent illness. The design was prospective and hence the causal inference is justified.

The present extention study expands the data base by continuing testing of subjects from the original study and adding subjects who are female, from other minority groups, and non-executive (contrasting with original sample). Both questionnaire and interview procedures will be used. The general aim of the questionnaires is to obtain from over 1500 subjects information concerning the personality variables of hardiness, coping techniques of transformational and regressive sorts, social support systems (social participation, social centrality, status consistency), stressful life events, illness and demographics. From existing medical records, information will be obtained regarding constitutional predisposition to and physical indices of illness. All data will be monitored over two testing sessions, separated by one year. Analyses will test hypotheses concerning the interaction of various of these resistance resources in dampening the debilitating effects of stress. These data will also be analyzed to determine age patterning. The interview study will attempt to determine the antecedents (in early experiences) and the consequences (in coping techniques) of the hardiness components.

This extension study is the next step needed in reaching the goal of developing educational and psychotherapeutic procedures whereby persons can be aided to increase in hardiness and thereby have an alternative to avoiding stressful life events in the attempt to remain healthy.

SEX DIFFERENCES IN MORBIDITY AND HEALTH ACTIONS

L.M. Verbrugge, University of Michigan, Ann Arbor Campus, Inst. for Social Research, Dept. of Biostatistics, *P.O. Box 1248, Ann Arbor, Michigan* 48109 (R01 MH 29478-04)

Health surveys consistently find that women have higher rates of illness, disability days, health services use, and medicine use than men. The principal goals of this research are to provide thorough explanatory analyses of sex differences in health and to define models for testing sex differences in both physical and mental health. Three general hypotheses about male-female differences in health are tested: (1) illness behavior (different propensities to perceive symptoms, evaluate them, and take curative actions), (2) acquired risks of illness and injury due to social roles, life styles, and stress, and (3) reporting behavior. As part of this research, we will examine some methodological features of health indicators and also analyze the daily dynamics of health events (asking how mood and special events trigger symptoms and health actions). The data source is the Health In Detroit Study, conducted in 1978 under a research grant (MH 29478) from the Center for Epidemiologic Studies. The study was designed specifically to explain sex differences in health. A probability sample of white adults in the Detroit metropolitan area was chosen. After an initial interview (n equals 714), respondents kept a Daily Health Record for six weeks. Each day they reported symptoms, restricted activity, medical/dental visits, medicines and treatments, communications with peers about symptoms, mood, and special events of the day. At the end of the diary period, a Termination Interview was conducted. The proposed grant will support comprehensive analysis of the Health In Detroit data. The research has theoretical and methodological significance for identifying (1) reasons for longstanding differences in the health of men and women, as reported in health surveys, (2) features of prospective reports, self-reports, comprehensive health indicators, and daily measures of health, and (3) factors which precipitate symptoms and which channel people into health services use and self-treatment.

BIBLIOGRAPHIC REFERENCES: Verbrugge, L.M. Female illness rates and illness behavior: testing hypotheses about 1979 sex differences in health. Women and Health, 4(1), Spring, 61-79. Verbrugge, L.M. Health diaries. Medical Care, forthcoming. 1979.

NATIONAL TRENDS IN PSYCHOTHERAPEUTIC DRUG USE

G.D. Mellinger, Inst. for Research in Social Behavior, *456 22nd St., Broadway Grand Plaza, Oakland, California* 94612 (R01 MH 29819-04S1)

The objectives of the studies described in this proposal are (1) to replicate and extend the 1979-71 national study of psychotherapeutic drug use in order to assess trends in drug acquisition and use, emotional distress, situational stress, cultural values bearing on medical care, attitudes toward psychotherapeutic drug use, and alternative ways of coping with distress: (1) to evaluate the methods used in the earlier study to classify persons according to levels and types of psychic distress, and to refine these methods for use both in the 1979 national study proposed and for general use in surveys of mental health; and (3) to provide accurate numerical bases for assessing implications of existing and future data on serious adverse reactions associated with particular psychotherapeutic drugs, and to collect data on occurrence of less serious adverse reactions that are not reported to physicians.

These objectives will be accomplished through two studies: (1) a methodological and pilot study using samples of (a) medical and psychiatric outpatients (N equals 200) and (b) the general population (N equals 287), who will be evaluated psychiatrically by clinicians and also interviewed at home by survey interviewers. Classification of psychic distress, especially anxiety and depression, based upon responses to a symptom checklist in the survey situation will be compared with clinical evaluations; (2) a national survey of the adult U.S. population aged 18 to 79 (N equals 3000). In this survey, data will be obtained on psychic and somatic distress; life crisis and other stressful life circumstances; use of psychotherapeutic drugs, alcohol, illicit drugs; other ways of coping with distress; attitudes about drug use, the medical system, and mental illness; beliefs about appropriate ways of dealing with psychic distress; and ocurrence of adverse drug reactions. Special attention will be given to these issues as they apply to older persons (69-79).

DETERMINANTS OF OUTCOME OF SEVERE MENTAL DISORDER

N. Sartorius, World Health Org., Division of Mental Health, *1221 Ave. Appia, Geneva 27, Switzerland* (R12 MH 29969-04)

This proposal describes a comparative prospective incidence study of broadly defined schizophrenic illness in 11 catchment areas in nine countries. The individuals identified in the process of case-finding will be assessed in a standardized manner, with the aim to document in detail their history, mental state, diagnostic classification, and social functioning. A two year follow-up of all patients will be undertaken to obtain data about course and outcome of the disease. Concurrently with this, hypotheses about the relationship between life stress, interaction in the family, and the relapse rate will be tested, and social and ethnographic information about the catchment areas collected in order to identify ecological correlates of incidence, relapse rates, and rates of disabil-

ity associated with schizophrenia. Characteristics of treatment of the patients in different centers will be described in a standardized manner. Anciliary evidence which might increase the explanatory power of the theoretical model underlying the study design, will also be collected from other sources of information. This will include use of disease registers in some of the centers to establish associations between schizophrenia and certain physical diseases, such as cancer.

The study aims to provide new knowledge about schizophrenia and other mental disorders; to develop further methods for cross-cultural and epidemiological studies in the field of mental health; to maintain and strengthen a network of centers collaborating in such studies; and to provide knowledge necessary for better management of mental disorders.

STRESSFUL LIFE EVENTS, SOCIAL SUPPORT, AND ILLNESS

A. Dean, Union University, Albany Medical College, School of Medicine, Dept. of Psychiatry, *47 New Scotland Ave., Albany, New York* 12208 (R01 MH 30301-04)

The aim of this study is to examine, in a longitudinal design, the causal patterns among stressors, social support and illness (physical and psychiatric disturbances). The study is designed to collect data in two waves from the same respondents in a representative sample of the normal population in the Tri-City area (Albany-Schenectady-Troy, New York). The first wave was collected in the Spring of 1979. The present investigation provides for a one-year follow-up (Spring 1980).

Specifically we are examining, causally, the potential intervening effect of social support on the relationship between stressors and illness. Two major research questions under examination are the extent to which stressors present in time 1 will affect illness in time 2.

Further, the history of illness, sociodemographic variables, and measure of internal control will be taken into account in an examination of these relationships. This elaboration would allow an investigation into the contributions of stressors and social support to illness relative to other causal (instrumental) variables.

GENETICS OF SCHIZOPHRENIA

M. Baron, New York State Psychiatric Inst., Dept. of Medical Genetics, *722 W. 168th St., New York, New York* 10032 (R01 MH 30608-02)

Genetic analysis is a promising avenue in psychiatric research. Defining a psychogenetic substrate would greatly enhance validating criteria for illness classification and would contribute to morbid risk prediction. Recent advances in quantitative genetics, diagnostic and biologic concepts of mental illness permit, for the first time, a critical test of genetic hypotheses of schizophrenia. A spectrum of schizophrenia-related states will be defined by matching the morbidity risk for mental disorders among first-degree relatives of schizophrenics with comparable data on normal controls. Illness subforms within the heterogeneous schizophrenia spectrum will be determined by current diagnostic and prognostic concepts. Family data on platelet monoamine oxidase activity, claimed to identify vulnerability to some schizophrenic subsets, will also be gathered. Recently formulated multiple-threshold models of inheritance will be applied to the data, assuming that liability thresholds can be defined by clinical and/or biological subtypes. Modes of inheritance, illness susceptibility and subsumption of disease-forms under a single genetic diathesis will thus be examined. The proposed strategy has not as yet come under investigative scrutiny in schizophrenia research.

MENTAL HEALTH RESEARCH CENTER SCHIZOPHRENIA STUDY

R.P. Liberman, University of California, Los Angeles Campus, Neuropsychiatric Inst., *760 Westwood Plaza, Los Angeles, California* 90024 (P50 MH 30911-04)

The Clinical Research Center consists of a 'core' research project that aims to provide a longitudinal, prospective, long-term, follow-through study of the course of schizophrenia from the time of initial illness episode. Repeated measures are taken of sociodemographic, economic, social network, familial, social competence, attentional, and electrodermal variables which are evaluated for their utility in (1) predicting relapse, exacerbation or remission; (2) revealing abnormalities during periods of time when a patient is in remission vs. in relapse; and (3) generating information on factors which contribute to relapse or successful adjustment in the community. Connected to this core study are five separate projects in three program areas — Family Studies, Clinical Psychopharmacology, and Social Rehabilitation. Studies of treatment research include clinical trials of family therapy and life skills training. Studies of clinical psychopharmacology include tests of dose-response relations in neuroleptic therapy. Studies of families include a concurrent and predictive validity study on communication style and expressed emotion, and a study of family factors in the course of schizophrenia among Mexican-Americans.

CLINICAL RESEARCH CENTER STUDY OF AFFECTIVE DISORDERS

D.J. Kupfer, University of Pittsburgh, School of Medicine, Dept. of Psychiatry, *3550 Terrace St., Pittsburgh, Pennsylvania* 15261 (P50 MH 30915-04)

Depression is the most common disabling psychiatric illness and the source of enormous human suffering. Depressive symptoms can be identified in over half of all patients seen in psychiatric practice and it is well known that only a small proportion of individuals suffering milder forms of depression ever seek medical attention. That depression feature almost inevitable in the wake of adverse life situations is accepted as part of the human condition. Depressive symptoms, however, also occur in association with chronic illnesses, or as sequelae of both acute and chronic illnesses and injuries, and are often observed in individuals who abuse alcohol, other central nervous system depressants, or narcotics. The Department of Psychiatry (WPIC) of the University of Pittsburgh Medicaa School in collaboration with the Departments of Psychology, Biological Sciences, and Pharmacology has established a MHCRC to investigate the etiology, epidemiology, and treatment of affective disorders. The MHCRC is providing the essential structure and fiscal core support in developing an integrated, multidisciplinary program of investigation, research training, and clinical service. The award of an MHCRC has substantially strengthened our clinical teaching and research programs; a number of scientific disciplines which were not represented are now included; the core support systems (clinical core, biostatistical core, administrative core, technical core, informed consent core, educational core, grants support core and core laboratories) essential for facilitating the integration of participating scientists and programs have been established and the productivity of the faculty has been visibly enhanced. Our clinical research program is organized around the following major themes: psychobiologic investigations; psychosocial factors (assessment and treatment); relationship between developmental stages and affective disorders; epidemiological aspects; and technological improvement of assessment and diagnosis. The basic research activities of the MHCRC is discussed around the four themes of cell-to-cell communication; neural plasticity; stress; and preclinical aspects of depression. In addition a series of new investigations will be developed under the aegis of the MHCRC.

NIMH-WHO STUDY ON THE DETERMINANTS OF MENTAL DISORDERS

A.J. Marsella, Queens Medical Center, Mental Health Services, *1301 Punchbowl St., Honolulu, Hawaii* 96808 (R12 MH 31016-02S1)

The purpose of the present project is to investigate the relationship of various psychosocial variables to the etiology, incidence, disability profile, course, and outcome of schizophrenia. The psychosocial variables under study include macrosocial variables (e.g., social structure, migration rates, health service utilization), microsocial variables (e.g., family structure and communication, social networks, family perceptions of the patient), and individual difference variables (e.g., demographic variables, life stresses, psychiatric treatment history, developmental history). The project is part of the World Health Organization's international collaborative study on the psychosocial determinants of schizophrenia and is being conducted simultaneously in England, Denmark, Czechoslovakia, India, Colombia, Nigeria, Japan, and the United States (Honolulu, Rochester). A major phase of the project involves a two year epidemiological study of first episode schizophrenic disorders in the various research sites using standardized research instruments and procedures.

NATURE AND EXTENT OF MODERATE DRINKING IN EX-ALCOHOLICS

J.E. Helzer, Washington University, School of Medicine, Dept. of Psychiatry, *660 S. Euclid Ave., St. Louis, Missouri* 63110 (R01 AA 03852-03)

We propose to carry out an epidemiological study of treated alcoholics to estimate the number who, five to ten years after treatment, have been social drinkers for at least three years. A consecutive series of 1,000 ex-patients who were released from hospital inpatient or outpatient treatment at least five years previously and who received a diagnosis of primary or secondary alcoholism at that time will be ascertained. We will review the subsequent inpatient and outpatient records of these patients, dividing the population into two groups: those with no records of having received additional psychiatric or medical treatment for alcoholsim or its complications within these facilities in the past three years, and those who do have such a record. We will locate and personally interview a random sample of the latter group and all of the former group. For those who on self-report meet our criteria for social drinking for all of the past three years, we will also interview a close family member and survey all subsequent treatment records to confirm their report. For those in whom the self-report of social drinking is confirmed, we will locate an interview and age- and sex-matched control living in the same city block as the subject, to enable us to compare drinking patterns of ex-alcoholics with those of persons who have never had a drinking problem.

We intend to describe the nature of the drinking of ex-alcoholics, correlates of social drinking, the environment in which social drinking can persist, and the methods that ex-alcoholics use to maintain their ability to drink socially.

ROLE AND ROLE CONFLICT IN WOMEN'S DRINKING PRACTICES

H.L. Metzner, University of Michigan, Ann Arbor Campus, School of Public Health, Dept. of Epidemiology, *Ann Arbor, Michigan* 48104 (R01 AA 03593-01S1)

The objectives of this study are to ascertain the drinking practices of woman in selected contrasting occupation groups and to determine how these practices relate to their work and family roles and the presence of role conflict. Five hypotheses will be tested predicting that more women will drink, drink more, and will be heavy drinkers: (a) who are in traditionally male occupations compared to those in traditionally female occupations; (b) who are exposed to socially approved job-related drinking; (c) who experience conflict among their work, family and other roles; (d) who have little social support in handling their problems; and (e) who feel inadequate in one or more of their roles. Women will be studied who are in the high risk situations described by the above hypotheses but who appear resistant to the risk of heavy drinking in order to find out those characteristics related to their lesser vulnerability. Alcohol use as a method of coping with stress and tension will be explored in relation to other preferred coping methods and these correlates determined.

A total of 1500 women will be studied, 300 in each of five occupation groups: professional or technical women in a traditionally male occupation; a similar category of workers in a traditionally female occupation; operatives or service workers in a traditionally male occupation; a similar category of workers in a traditionally female occupation; and married housewives not employed outside the home. The employed women will be selected from lists and the housewives by a dwelling unit probability sample. The data will be collected by a personal interview conducted by trained interviewers in the respondent's homes.

Multivariate analysis will be employed taking into account the known and anticipated complexity of the relationhips between drinking practices and psychosocial variables.

SOCIAL EPIDEMIOLOGY OF ALCOHOL PROBLEMS

W. Winkelstein, University of California, Berkeley Campus, School of Public Health, Dept. of Social & Administrative Health Sciences, *Berkeley, California* 94720 (P50 AA 03524-03S1)

Four separate research projects are a part of the research center grant: 1. A study of community responses to alcohol problems involves description and analysis of all agencies dealing with alcohol problems in a study community. Formal treatment agencies are included, as are organizations such as AA, but also included are police, clergy and others who encounter alcohol problems. Community surveys of general populations will be included if possible. 2. An Historical Study of Alcohol Control policies in the U.S. is being undertaken using a combination of historical research methods and analysis of various official records. The intent is a description of the actors and interests who have played significant roles in the development of U.S. policies regulating alcohol use in the years since the turn of the century. 3. The Study of the Structure and Political Economy of the Alcoholic Beverage Industry makes use of published and unpublished data on production and distribution of alcoholic beverages plus materials from trade publications, various secondary sources, etc., to describe the interplay of production, consumption and regulation in the years since the repeal of Prohibition. 4. A study of Alcohol Use and Casualties is concerned with the relationships between alcohol use and such things as accidents, crime, and other casualties. Both aggregate level and individual level data (as from surveys) will be used to describe empirically the relationships among the rates of consumption and problems.

Projects 2-4 are part of an international study coordinated by WHO European Office which coordinates research on these same topics in Canada, Finland, Ireland, Japan, Netherlands, Poland, Switzerland and in the U.S.

CENTER FOR THE STUDY OF ALCOHOLISM

R.U. Massey, University of Connecticut, Health Center, School of Medicine, Dept. of Psychiatry, *Farmington Ave., Farmington, Connecticut* 06032 (P50 AA 03510-03)

In a series of related and interrelated studies, we propose to examine genetic, behavioral, biochemical and psychopathological aspects of alcoholism. In a follow-up study of factor analytically derived typologies of male and female alcoholics, we propose to develop a multidimensional prediction model of treatment outcome empirically derived from an extensive data base of behavioral, sociological, psychopathological, demographic and pedigree assessments obtained from large sample of alcoholic patients. In some individuals, this will include a systematic assessment of tolerance. Patient outcome will be assessed periodically utilizing a broad range of outcome criteria and using a life insurance table approach to the assessment of 'risk' and 'treatment impact'. Separate prospective studies of antidepressant and lithium treatment will be carried out in a similarly designed format.

In addition to pedigree assessments, we propose to carry out a comparative prospective longitudinal study of young adult children of alcoholic and nonalcoholic individuals.

Finally, studies on the importance of stimulus control of drinking behavior in alcoholics and normal subjects will focus on respondent and operant conditioning in alcoholics. These studies will also be carried out in a clinically relevant context.

Findings from the proposed work should contribute to improved alcoholism treatment and prevention strategies and to greater understanding of the multivariate nature of the disorder.

THE ETIOLOGY OF ALCOHOLISM

J.A. Carpenter, Rutgers the State University of New Jersey, New Brunswick Campus, Center for Alcohol Studies, *Old Queens Bldg., New Brunswick, New Jersey* 08903 (P50 AA 03509-04)

This prospective, multiple cohort, longitudinal study of the etiology of alcoholism has as its objective the elucidation of those antecedent factors in the individual which confer an increased risk of developing alcohol problems. Since we believe it likely that addiction to alcohol, and to other drugs, results from an intermingling of constitutional and environmental influences, our assessment of individuals employs measures from a variety of disciplines (e.g. sociology, psychology, physiology, biochemistry) to characterize our subject population. Now in its third year, the study completed intake of the first wave of 475 adolescents in February 1980, equally divided as to sex and as to birth cohorts of 1961, 1964 and 1967, and has more than half completed the second wave of participants of birth years 1962, 1965, and 1968. In about April of 1982, Wave 1 will be retested, as will other Waves at 3-year intervals to age 24, and thereafter at 6-years intervals. The data base consists of about 5,000 items per subject and is now in the preliminary stages of statistical and other analysis; because initial intakes are of different ages, we shall also be able to provide cross sectional analyses of the data. We expect that our results in the near future will be useful in strategies of prevention and in the guidance of public policy relating to alcohol and drug use.

PATHOLOGIC & TOXIC EFFECTS OF ALCOHOL

J. Wolf, City University of New York, Mount Sinai School of Medicine, School of Medicine, Dept. of Medicine, *1 Gustave L. Levy Pl., New York, New York* 10029 (P50 AA 03508-04)

Our interdisciplinary team will conduct studies in patients as well as in our experimental models of alcoholic injury in rats and baboons in which liver lesions seen in the alcoholic (including cirrhosis) were reproduced. We plan to assess biochemical differences between alcoholics and nonalcoholics and to apply these findings to the validation of a blood test for alcoholism. Alterations of alcohol metabolism and the role of protein retention, acetaldehyde toxicity and immunological reactions in the development of alcoholic liver diseases will be determined. The nature of the abnormality in collagen metabolism will be evaluated. We plan to study the pathogenesis of alcoholic fatty liver and to develop a blood test which might enable us, in a population of heavy drinkers, to detect those whose alcoholic intake has resulted in significant liver damage beyond the fatty liver stage. We will also try to define a precirrhotic lesion which might allow us to predict which alcoholics might develop cirrhosis, thereby enhancing our effectiveness in the prevention of this complication. Other attempts at prophylaxis will include the definition of nutritional and preexisting medical conditions that favor the development of cirrhosis and portal hypertension when associated with heavy drinking. Pathogenesis of alcohol induced muscle, intestinal and pancreatic lesions will be assessed, including the carcinogenic role of alcohol. Involvement of microtubular alterations in chromosomal abnormalities and their link to the fetal alcohol syndrome will be determined. Androgen and estrogen abnormalities associated with alcoholism will be evaluated through measurements of hormone levels and clearance rates in the blood enzyme activities in the liver. Our baboon model will be made available as a resource to other interested investigators. The ultimate goal is the application of the newly acquired knowledge to the successful prevention and treatment of alcohol related diseases.

GENETIC AND EXPERIMENTIAL ANTECEDENTS OF ALCOHOLISM

D.W. Goodwin, University of Kansas, Medical Center, School of Medicine, Dept. of Psychiatry, *39th St. & Rainbow Blvd., Kansas City, Kansas* 66103 (R01 AA 03448-03)

The study has two objectives: (1) Investigate the relative influence of genetic and experiential factors in the development of drinking patterns, psychopathology, and personality traits, by comparing adolescents of alcoholic parentage with controls of nonalcoholic parentage in a 15-year follow-up of an extensively studied obstetrical cohort. (2) Use this information as a data base for subsequent follow-up of the cohort into adulthood to identify high-risk factors antedating the onset of drinking problems and other psychopathology.

The sample consists of 300 male individuals (age 15-17) who were in a group of 9,182 children studied perinatally and during the first year of life by physicians at the University of Copenhagen, Denmark. Two-hundred subjects had a parent treated for alcoholism. The other 100 subjects are controls matched for age, sex, and socioeconomic class of the parent. Phase 1 (this grant) involves studying the children just as they are entering the age of risk for the development of drinking problems. The examination includes interviews with the parents; a psychiatric and psychosocial interview of the children; neuropsychological and psychological tests; a neurological examination; psychophysiological and neurophysiological recordings; and biochemical studies. Phase 2 of the study involves periodic reexamination of the subjects over a period of 10-15 years to identify factors that predict drinking problems and other psychopathology in later life.

A PROSPECTIVE STUDY ON FETAL ALCOHOL SYNDROME

S.I. Miller, Case Western Reserve University, School of Medicine, Dept. of Psychiatry, *2109 Adelbert Rd., Cleveland, Ohio* 44106 (R01 AA 03282-03)

The proposed project is a six year, prospective study on the fetal alcohol syndrome. The overall goals of the study are to determine the incidence of fetal abnormalities secondary to excessive alcohol consumption, and to examine the efficacy of intensive alcoholism treatment in reducing the frequency of fetal anomaly. Four phases are proposed. The first is a Discovery and Screening Phase (2 years) using the Michigan Alcoholism Screening Test (MAST) as part of the high risk screening conducted by the prenatal clinic at Cleveland Metropolitan General Hospital (CMGH). During this period, pregnant women scoring positively and negatively on the test will be identified. Concurrently, the Treatment and Prenatal Monitoring Phase (2 years 9 months) will consist of randomly assigning positive MAST responders to high intensity and low intensity treatment and an equal number of negative responders to a non-alcoholic comparison group. In the low intensity group, routine prenatal monitoring and Alcoholics Anonymous are the only treatment modalities to be employed. In the high intensity treatment group, identified women will be enrolled in an intensive abstinence-oriented treatment program consisting of individual counselling, specialized group counselling and referred to Alcoholics Anonymous. Fetal outcome will be assessed in the low-intensity treatment group, the high intensity treatment group, and the non-alcoholic comparison group. Subgrouping will determine the results for individuals who accept or reject treatment. The prenatal monitoring will consist of monthly evaluations of volume and pattern of alcohol intake using the Volume Pattern Index; social, physical and economic factors using the Data Base Sheet for Alcohol Related Problems; monthly dietary assessment, monthly blood alcohol levels and routine prenatal monitoring as part of the antenatal clinic visit to CMGH through parturition. The Postnatal Outcome Analysis Phase (3 years) will involve physical, neurological and psychological examination of all study infants (alcohols and controls) to be done at birth, and ages 6 months, 1 year, 2 years, and 3 years. The Statistical Analysis Phase (9 months) will be major analysis on the data collected during the first three phases of the study. Quarterly reporting will occur throughout the six years of the study.

THE ROLE OF ALCOHOL IN MIGRANT POLYNESIAN ADAPTATION

T.D. Graves, South Pacific Research Inst. Inc., *Opanuku Rd. R.D.1 Henderson, Auckland, New Zealand* (R01 AA 03231-03)

This cross-cultural comparative study examines the role of alcohol, and in particular peer drinking groups, in the urban adaptation of Samoan, Cook Islander, and Maori migrants to Auckland, New Zealand. Our specific aims are: 1) To describe their typical patterns of peer group drinking behavior in public bars, based on systematic observational procedures, and to test hypotheses concerning the relationship between size and composition of the drinking groups and amount of alcohol consumption. 2) To identify and classify sequences of critical incidents in these settings which are likely to lead to interpersonal conflict and violence. 3) To conduct a survey interview among samples of these Polynesian migrants and a white comparison group in similar socio-economic circumstances, to test hypotheses concerning the relationship between background experience and personality, the choice of various adaptive strategies for coping with urban stress including participation in peer drinking groups, and various psychological/physiological/psychosomatic stress symptoms. 4) To compare the results among Polynesian and white New Zealanders with the role of alcohol in the urban adaptation of Navajo Indian migrants to Denver, Colorado.

3.0316,

A STUDY OF ALCOHOL AVAILABILITY AND ALCOHOL ABUSE

H.D. Holder, Human Ecology Inst., *Chapel Hill, North Carolina* 27514 (R01 AA 03170-02)

In the most simplistic sense, the abuse of alcohol is related to its availability, i.e., if there is no alcohol available, no consumption occurs and no abuse is possible. However, the number of factors which affect or influence consumption and abuse are multiple.

Many studies of alcohol abuse show positive correlation between availability and abuse. While it is unlikely that correlational findings are causal, that is, availability directly causing abuse, there do exist positive relationships. These relationships are most likely complex networks of interrelated variables which affect one another over time. There have been few research efforts to examine the complex relationships between availability and abuse as a total or 'whole.'

This project seeks to solve these limitations by undertaking a three-year study of the relationships between availability and abuse through the use of a computer-based model which will integrate in a wholistic manner the most significant variables. The focus of this project is to explore the feasibility of and to test the capability of computer-based model to incorporate the best available knowledge and experience about alcohol availability and abuse. The project will carry out sensitivity analysis with the model to locate those variables which are most sensitive to change over time (i.e., would be most affected by changes in other variables), and to carry out simulation experiments to plot the projected effects of changes in the significant and most powerful variables in the model and to prepare reports on findings.

3.0317,

HEREDITY, ALCOHOL USE, TEMPERAMENT & CHD RISK FACTORS

E. Harburg, University of Michigan, Ann Arbor Campus, School of Public Health, Dept. of Epidemiology/Psychology, *Ann Arbor, Michigan* 48104 (R01 AA 02884-04S1)

The purposes of this study are to continue developing a survey approach to sampling sets of families in a given population to estimate the amount of genetic contribution to a variety of health-related variables for the purposes of (1) removing the effects of the genetic variance from alcohol-related traits and testing for environmental relations and (2) creating models for estimating heritability of given traits of interest.

The first objective then is methodological: (1) to validate the 4-person Family Set Method by use of genetic markers, and (2) vary the composition of Family Sets to include multiple sibs and first cousins and compare results on genetic markers to simple four-person Sets. The second objective would be to estimate the roles of nature-nuture in alcohol usage, cardiovascular health-risk factors, and specific temperaments, e.g., Extraversion-Introversion and Neuroticism. The third objective is to statistically standardize or remove the genetic effects, if any, and test for relationships among alcohol usage, temperaments, family behavior, health risk factors and demographic categories.

The study sample will be Family Sets (Index, sib, first cousin, unrelated person) drawn from (1) Cardiovascular Exam I (1960-61), and (2) from Cardiovascular Exam II (1963-65). About 265 Sets (after losses) are available with questionnaires collected in 1977 with data on alcohol usage, temperament, and health habits.

PROBLEM DRINKING, DELINQUENCY, AND MATURATIONAL REFORM

S.R. Burkett, Washington State University, Graduate School, Dept. of Sociology, *Pullman, Washington* 99163 (R01 AA 02620-05)

The proposed research is a renewal of an ongoing study investigating the dimensions and determinants of adolescent problem drinking and delinquency involvement. Our principal concerns are the study of social maturational development and reform as this relates to involvement in and the cessation of adolescent problem drinking; and the impact of legal intervention in the lives of adolescents. The major focus is upon differential degrees of involvement in and attachment to conventional social institutions and people, and commitment to conventional goals. We also focus on various personal controls and belief systems relating to the law, and the perceived consequences of alcohol use and abuse. The research is a panel study involving a cohort of youth from a medium-sized community in the Pacific Northwest. Data sources a questionnaire survey, and school and juvenile court records. Primary goals include theoretical development and refinement, and policy recommendations.

AN ANALYSIS OF THE DEMOGRAPHIC AND ATTITUDINAL CORRELATES OF ADOLESCENT DRINKING

J. Shriver, Gallup Org. Inc., *53 Bank St., Princeton, New Jersey* 08540

The Laboratory of Epidemiology and Population Studies is mandated to conduct and sponsor research in areas appropriate to an understanding of the etiology and natural history of alcohol abuse and alcoholism. As part of this responsibility for developing a program of basic and applied epidemiological research, a systematic review of the psychosocial correlates relating to adolescent drinking behavior is required. The Contractor will provide baseline data on a national level for adolescent drinking levels and problems associated with drinking and provide information for further understanding of the circumstances of adolescent drinking as well as demographic and attitudinal correlates. The purpose of this project is to provide current information on U.S. adolescents, ages 13 to 18. The information must include but not be limited to knowledge, attitudes and behavior pertaining to alcohol consumption and alcoholism among American adolescents.

3.0322,

A LONGITUDINAL STUDY OF CHILDREN OF DRINKING MOTHERS

J.W. Kuzma, Loma Linda University, School of Health, Dept. of Biostatistics & Epidemiology, *Loma Linda, California* 92354 (R01 AA 00688-06S1)

The interest in the effects of drinking during pregnancy has grown rapidly following the early publications on the fetal alcohol syndrome by Jones and Smith in 1973. The results of various studies to date suggest an adverse relationship of heavy maternal alcohol use during pregnancy on the offspring. There still remains, however, some unanswered questions such as: 'What is the effect of moderate drinking on the offspring? What are the possible synergistic effects of alcohol use with other substances such as smoking? What are the long term development effects of maternal alcohol use on the offspring? Does termination of maternal drinking during the early stages of pregnancy reverse possible adverse effects on the offspring? A five-year prospective study of 1,320 children ages 2 to 5 is proposed to provide information to help answer these questions. The 1,320 children are to be selected from an ongoing study of 10,000 pregnant women on whom we already have extensive prenatal, labor delivery and birth information. For each participate we will annually assess the home environment, parent-child interactions, demographic and psychosocial factors by means of a home interview. Physical and mental characteristics on each child will be assessed by a pediatric nurse and a psychometrician at the first and fourth year at a visit to our clinic. The study design calls for three different comparison groups which will provide data to determine the role that alcohol use during pregnancy played on subsequent development characteristics. By being able to provide data concerning the possible harmful effects of drinking during pregnancy on the offspring, information will be made available that can be used to initiate prevention programs to hopefully reduce morbidity and disability and cut the cost of care of premature infants in the community.

3.0323,

FAMILY DETERMINANTS OF THE COURSE OF ALCOHOLISM

P.J. Steinglass, George Washington University, School of Medicine & Health Sciences, Dept. of Psychiatry & Behavioral Sciences, *2121 Eye St. N.W., Washington, District of Columbia* 20037 (R01 AA 01441-07)

A follow-up study has been proposed to further investigate a theoretical model of chronic alcoholism in the family called the life history model. This model was suggested by data from an initial study in which the interactional behavior of 31 alcoholic families was observed in three settings (home, multiple family discussion group (MFG), and family laboratory). When these families were divided into three different alcohol life phases as suggested by the theoretical model (stable wet, stable dry, and transitional phases), selected dimensions of interactional behavior in all three settings were found to vary in association with the family's alcohol phase.

The follow-up study addresses two questions: (1) whether a family's behavior pattern will change if its alcohol phase changes; and (2) the influence of family 'personality' variables on the differential course of chronic alcoholism using the life history concept.

The follow-up study will re-examine behavior in our original sample of alcoholic families two years after the first data collection period. A three month panel of data collection again includes home observation and discussion group settings. In addition, extensive clinical interview data and questionnaire data about family functioning is collected. Findings from the follow-up study are to be combined with the original findings to further advance the life history model of the alcoholic family. This model is intended to suggest a typology of alcoholic families with predictive power regarding prognosis and treatment of choice for families with alcoholic members.

INHERITANCE OF BEHAVIOR AND METABOLISM IN ALCOHOLISM

R.J. Cadoret, University of Iowa, School of Medicine, Dept. of Psychiatry, *Jessup Hall, Iowa City, Iowa* 52240 (R01 AA 04750-01)

An adoption study design will be used to test hypotheses about the inheritance of alcoholism. Two groups of adoptees will be followed up and compared: Group A) 100 adoptees without alcoholism in their biological families. All were separated at birth from biologic relatives. Data collected will be personal interviews with adoptive parents, structured psychiatric interview with adoptees, laboratory testing of alcohol metabolism in adoptees, school, medical and therapeutic records of adoptees. Group A and Group C will be compared to test the following hypotheses: 1) adoptees from alcoholic biologic background (Group A) will have a higher incidence of alcoholism than the control adoptees (Group C), Group A adoptees will metabolize oral ingestions of alcohol (as measured by acetaldehyde and ethanol concentrations) differently than Group C adoptees, 3) Group A adoptees will have a higher incidence of adolescent antisocial behavior than Group C adoptees. All researchers will remain blind to biologic background of adoptees.

3.0326,

PROBLEM DRINKING IN WOMEN:

S.C. Wilsnack, University of North Dakota, School of Medicine, Dept. of Neuroscience, *Grand Forks, North Dakota* 58201 (R01 AA 04610-01)

Studies of women's drinking and drinking problems have been limited mainly to atheoretical analyses of small clinical samples, using bivariate data analysis. The research proposed here would overcome these limitations by a national survey of antecedents, patterns, and consequences of women's drinking, allowing multivariate analyses based on a complex theoretical model.

The model contains three major sets of antecedents of women's drinking: (1) personality characteristics (drinking related motives, beliefs, and self-restraints); (2) perceived social environment (value supports, drinking norms, drinking opportunities and models); and (3) life experiences (deviant behavior, affective disorders, sexual functioning, OB-GYN disorders, stressful life events). The antecedents affect amounts and frequencies of women's drinking, contexts of drinking, and personal and social consequences of drinking.

Evaluating the model and sex differences in drinking will involve interviewing national samples of 500 women who drink moderately or heavily, 500 women who drink lightly or abstain, and 500 men. A pretested questionnaire will use previously validated measures plus new queries about aspects of women's drinking not covered by previous surveys. Path analysis of the data will be supplemented by analyses of demographic subgroups and intergroup comparisons (e.g., between sexes).

Identifying the complex influences on women's drinking and drinking problems will help prevention and treatment programs become better targeted to the special needs of women with drinking problems.

3.0327,

ALCOHOLISM TRANSMISSION VIA FAMILY RITUAL

S.J. Wolin, George Washington University, School of Medicine & Health Sciences, Dept. of Psychiatry & Behavioral Sciences, *2121 Eye St. N.W., Washington, District of Columbia* 20037 (R01 AA 01454-06S1)

This continuation application proposes a second study on family factors involved in the intergenerational transmission of alcoholism. In the initial study, families with alcohol abuse in two generations--transmitters--have been compared with families having only parental generation affected--non-transmitters. The characteristics of ritual behavior in daily life have been compared in both groups. The transmitter group has been found to develop a preponderance of rituals involving alcohol abuse, subsuming the normal ritual functions in family living. These families have been labelled 'subsumptive,' distinguishing them from 'distinctive' families where normal ritual behaviors do not include alcohol abuse. In transmitter families selective sibling involvement appears related to a second family factor--the continuation or rejection of the family's heritage. This is particularly true at the time of offspring marriage when the selection of a family identity for the new couple will normally allow one origin family or the other to predominate as the family of heritage.

In the proposed study we have revised our structured interviews and criteria for subject population to perform a within-family sibling comparison. The objective will be to assess the likelihood that each married child will repeat in the successive generation his parent's alcoholism. Siblings will be compared as to the subsumptiveness of their origin families and their family identity selection. Subjects will include thirty transmitter families with approximately ninety married couples and their parents, when available. Individual and conjoint couple interviews will be standardized and a manual will be prepared for rating origin family type and family identity selection. Drinking patterns of all family members will be separately assessed and scaled. A rating of the likelihood for alcoholism transmission for each sibling will then be compared with actual drinking behavior to evalu-

ate the relationship between alcohol abuse rituals, family identity and the recurrence of alcoholism.

3.0328,
DRINKING AND CONDITIONED ANXIETY

C.M. Steele, University of Washington, School of Arts & Sciences, Dept. of Psychology, *Seattle, Washington* 98195 (R03 AA 04914-01)

Research is proposed to examine the relationship between drinking and 'conditioned anxieties' such as cognitive dissonance (Festinger, 1957) and guilt, that are aroused by behaviors and events which contradict an individual's internalized values and self-concepts. The approach taken in this research is social psychological in the sense that it examines a set of social situational and interpersonal antecedents that by producing a particular type of negative affect, may foster drinking. It is specifically proposed that tensions such as dissonance and guilt may increase self-regulated drinking because of its actual and reputed ability to induce positive affect, and that by reducing these tensions, drinking may eliminate subsequent efforts to rectify their causes. Two experiments bearing on the relationship between drinking and cognitive dissonance, which provided preliminary support for this reasoning, are described. Four investigations are proposed to examine the following issues: 1) the replicability of the preliminary findings and their generalizability across different drinking habits, 2) whether the observed effects are mediated physiologically through the pharmacological effects of alcohol, or cognitively, through expectations, 3) whether the predicted effects generalize to the relationship between drinking and guilt, 4) whether personality traits of the subjects in these experiments can be identifed which may predispose alcohol abuse in situations laden with conditioned anxiety. Results from this research should help to 1) gain a clearer understanding of the relationship between drinking and negative affect, 2) broaden social psychological theories of consistency processes to incorporate the possibility of self-induced positive affect as response to psychological inconsistency, 3) provide initial data relevant to identifying a subpopulation of alcohol abusers and potential abusers who are especially susceptible to drinking in response to conditioned anxieties.

ALCOHOL INTAKE DURING PREGNANCY:

A.P. Streissguth, University of Washington, School of Medicine, Dept. of Psychiatry & Behavioral Sciences, *A-300 Health Sciences Ctr., SC-64, Seattle, Washington* 98195 (R01 AA 01455-05S1)

Studies of offspring of chronic alcoholic women have revealed a pattern of malformation with accompanying brain dysfunction termed fetal alcohol syndrome. Prospective study of a cohort of 500 infants (selected from 1529 consecutive pregnancies) indcates that offspring of heavy social drinkers compared to controls had poorer learning on neonatal operant tasks and poorer habituation, as well as more dysmorphic features suggestive of fetal alcohol syndrome, although some of these findings were confounded with a nicotine/alcohol interaction. Unusual brain findings similar to those found in offspring of chronic alcoholic mothers were also found, although sample size was very small.

The purpose of the presnt study is to re-examine the same cohort of 500 infants again at age 4 years to study the effects of heavy social drinking duing pregnancy on cognitive, motor and language development, on growth parameters and morphological development, and on behavior and neuropsychological function.

LIFE PROBLEMS AND ALCOHOL USE IN AN URBAN POPULATION

R.W. Hingson, Boston University, School of Medicine, Dept. of Socio Medical Sciences, *80 E. Concord St., Boston, Massachusetts* 02215 (R01 AA 02133-05)

We propose to extend data analysis in our study of life stress and drinking practices in the Boston metropolitan area. Possible relationships between life satisfactions, problems, major events, and drinking practices will be analyzed, based on a longitudinal study of more than 1000 Boston area residents surveyed at four points in time over a 2 1/2-year period. (The final wave of data collection in the project will be completed in June, 1980.) The longitudinal design of our study with multiple data collection points offers us an unprecedented opportunity to explore relationships between changes in life satisfactions and situations and changes in drinking practices. Because our data have been collected at four points in time, we will be able to make a preliminary exploration of whether the changes individuals report in their drinking reflect oscillation around their usual drinking patterns or consistent shifts to heavier or lighter drinking. We also can explore whether changes in life situation precede or follow changes in drinking.

TEN YEAR PROSPECTIVE COMMUNITY STUDY OF TEEN SMOKING

S.G. Kellam, University of Chicago, Pritzker School of Medicine, Dept. of Psychiatry, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (R01 DA 02591-01)

This application requests support for analyses of community-wide prospective, longitudinal data, already in hand, on the origins of cigarette smoking by teenagers from a poor, black, urban community. The focus of the study will be on the developmental factors--both sociological and psychological--important to cigarette smoking behavior.

Our major areas of study will be: (1) the early and continuing impact on teenage smoking of peer and family structure, social interaction within and outside the family, and psychological atmosphere of the family; (2) the longitudinal relationships of social role performance (or social adaptation as we have defined it) and psychological well-being to the origins of cigarette smoking; (3) the early and continuing factors influencing smoking by teenagers in contrast to (a) psychiatric symptoms and psychological well-being generally; (b) the use of alcohol and drugs; (c) school achievement; and (d) antisocial behavior.

The data on the teenagers and their families are community-wide, longitudinal, and epidemiological, having been collected prospectively from the time the children were in first grade (1966-1967) until ten years later when they were 16-17 years old. Data collected on the study population include extensive social adaptational and psychological information in first grade and at the ten year follow-up. Other data such as IQ and school grades have also been gathered.

These analyses are aimed at furthering our understanding of the early social and psychological origins and developmental paths leading to smoking.

GROUP HOME TREATMENT AND ADOLESCENT DRUG ABUSE

C.J. Braukmann, University of Kansas, Lawrence Campus, School of Liberal Arts & Sciences, Dept. of Human Development, *112 Bailey Hall, Lawrence, Kansas* 66045 (R01 DA 02313-02)

The aims of this research are: (1) to evaluate the effects of group home placement on drug use of delinquent youths, and (2) to analyze the relationship between drug use and various behavioral influences. Subjects for the study will be 100 treatment youths from 14 Kansas group homes, and a comparison group of youths who were named by the treatment youths as their friend at the time of placement. A self-report questionnaire will be used to measure the drug use of treatment subjects (a) during the year and the month prior to placement, (b) each month during treatment, and (c) once each month for 6 months following treatment. Data on the drug use of comparison youths will be collected on the same schedule. The effects of the group home will be examined by group comparisons as well as comparisons across pre, during and post treatment conditions. Characteristics of the group home families, as well as of the natural families of the friend sample, will be measured by youth and parent questionnaires. The group-home families will be periodically measured through direct behavioral observation; the natural families of 30 friends of the group-home youths will also be observed directly. Questionnaire and direct behavioral measures will emphasize parental adult reinforcing value and social teaching. Questionnaire data will also be collected concerning the experienced or anticipated differential consequences for drug use which are provided by peers or school teachers, or which are personal (physical or psychological) in nature. All treatment youths will also be asked to name their best friend in the group-home once each month in order to see if entering youths select friends that are similar to themselves in drug use or come to match the drug use of their friends. The data on parental adult influences, differential consequences, and peer drug use will be used in correlational analyses, with subjects' drug use as the primary outcome variable.

3.0334,
DRUG ABUSE TREATMENT AND SUBSEQUENT CRIMINAL BEHAVIOR

L.A. Shuerman, University of Southern California, School of Letters Arts & Sciences, *3551 University Ave., Los Angeles, California* 90007 (R01 DA 02387-02)

The main objective of the study is to examine the impact of drug abuse treatment on subsequent criminal behavior of opiate users. Information for the study is provided by two automated data bases. One file consists of all opiate drug abuse clients serviced by the Los Angeles County Drug Abuse Program; the second consists of the entire State of California Arrest Citation and Offender Disposition file maintained by the Bureau of Criminal Statistics. Both data bases cover the same four-year period.

An important aspect of the study is that it will for the first time integrate on a large scale clients in opiate treatment programs (e.g., over 15,000 cases) with all official criminal justice information. In this way, then, the actual magnitude of this particular group's criminal activity can be assessed with a sample size which is large enough to control for many important research issues. The analysis is designed to include the following comparisons: between groups, within groups, and between treatment populations. The first general category involves the comparison between the treated drug abusers, the general population, and the offender population. The second category of comparison utilizes an Offender-Based Transaction system and concentrates on comparisons between types of offenders and their various dispositions within the criminal justice system on the basis of an addict-no-addict distinction. The third comparison is within the drug treatment system and examines the impact of various programs as related to reduction in criminal activity.

3.0335,

DRUG ABUSE AND OTHER DEVIANT ADAPTIONS TO STRESS

H.B. Kaplan, Baylor College of Medicine, School of Medicine, Dept. of Psychiatry, *1200 Moursund Ave., Houston, Texas* 77025 (R01 DA 02497-02)

This prospective longitudinal survey study will test and appropriately reformulate theoretical models representing mutually interacting, psychosocial influences upon the adoption, maintenance, reduction, escalation, and discontinuance of drug abuse patterns as well as each of a broad range of other deviant adaptations to life events between early adolescence and young adulthood. 'Other deviant adaptations' include modes of functional psychiatric disorders, interpersonal violence, alcohol abuse, suicidal behavior, 'prosocial acting out,' stealing, and vandalism as well as independently determined indices of self-rejection and correlated subjective distress. The models will consider common influences upon drug abuse and other modes of deviance as well as influences that are 'unique' to the explanation of drug abuse patterns and other deviant responses considered individually. Data on the mutually interacting variables said to influence deviant adaptations (including coping/defensive patterns, personal values, social positions, life events, and specified early deviant adaptations as these influence other deviant outcomes at a later date) were collected in the course of an earlier longitudinal study of 9,335 7th graders who responded to a questionnaire in 1971, 1972 and 1973. Data on intervening and current deviant adaptations and their consequences, intervening life events, and other theoretically relevant variables will be collected by follow-up semi-structured household interviews with the same subjects first interviewed in their early adolescence. The follow-up interviews will be completed over a three-year period when the subjects will be young adults (generally 22 and 26). The mathematical analysis will entail structural equation models (and their functional equivalent for qualitative variables).

A NEW TECHNIQUE FOR MEASURING HEROIN PREVALENCE

I.H. Cisin, George Washington University, Columbian College of Arts & Sciences, Dept. of Sociology, *2121 Eye St. N.W., Washington, District of Columbia* 20037 (R01 DA 02553-01)

The objective of the proposed methodological research is to improve the validity of prevalence estimates concerning heroin use and other highly stigmatized behaviors. This goal is pursued through the development and trial of a new data collection/estimation technique which has been designed to reduce the problem of respondent denial in surveys of particularly sensitive behaviors. This new technique has been provisionally termed the 'item count technique.'

The conventional wisdom for minimization of question threat has proved inadequate for the study of behaviors such as heroin use; indeed, the available evidence indicates that official figures on heroin use may underestimate true prevalence by substantial margins. Since 1965, a number of innovative approaches have been developed with the purpose of reducing the problem of respondent denial. These indirect survey-based estimation techniques allow a statistically unbiased estimate of a sensitive behavior without requiring the respondent to articulate a direct response to the sensitive question. The newest and most promising technique in this series is the item count technique devised by the Social Research Group. Experience with previously reported techniques (e.g., randomized response) has revealed a variety of problems encountered in the field--problems which may undermine the overall validity of resulting estimates. In contrast, the strikingly simple item count technique is capable of avoiding all serious field-application problems.

The development and preliminary evaluation of the item count technique is proposed here in terms of the lifetime prevalence of heroin use. The proposed work includes (1) item development based on pretesting in both 'normal' and high-drug-use residential areas, and (2) a relatively inexpensive test of the technique's performance in a large-scale survey application. Heroin prevalence estimates obtained via the new procedure will be compared with existing conventional and indirect estimates.

MEDICAL EXAMINERS PROJECT

J.T. Weston, Forensic Sciences Foundation Inc., *225 S. Academy Blvd., Suite 201, Colorado Springs, Colorado* 80910

One of the major tasks of the National Institute on Drug Abuse (NIDA) is the identification of drug abuse patterns, including the measurement, estimation, and assessment of the size and location of the Nation's drug abuse population. Direct measurement of drug abuse is possible only when people become identified through some external events, such as, hospitalization, entry into a drug abuse treatment program, death from a drug-related cause, arrest, and the like. It is not possible to identify, and therefore to count, drug abusing persons who do not become identified in these ways or who do not admit to drug abuse when questioned in a general population survey. Therefore, lacking the ability to directly measure the total drug abusing population, estimates of this population must be based on drug abuse indicators, i.e., measurements of those drug abusers who are identified. The commonly used drug abuse indicators include, hospital's records, drug abuse treatment program data, and medical examiner reports. In order to interpret and study the implications of medical examiners' reports on a national level, a consistent reporting procedure must be developed. Specifically, consistent definitions of a drug-related death must be set forth and the procedures used to determine these deaths must be detailed. The purpose of this procurement is to develop and pilot test a procedure manual to be used by medical examiners in reporting drug abuse related deaths. Objectives: 1. Identify current problems in the determination and reporting of drug involved deaths by medical examiners. 2. Develop a manual of standardized reporting definitions and operating procedures for medical examiners for determining drug related deaths. 3. Test the feasibility of implementing standardized definitions and procedures for a period of six months among a panel of medical examiners.

RESEARCH CENTER - STUDIES OF DRUG DEPENDENCE AND ABUSE

C.R. Schuster, University of Chicago, Pritzker School of Medicine, Dept. of Psychiatry, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (P01 DA 00250-08)

The Drug Abuse Research Center has continued: 1) to provide a formal structure designed to encourage the cooperation of basic research scientists and clinical researchers in problem-oriented research, 2) to encourage communication among basic research scientists working in related fields, 3) to promote the development and/or expansion of certain key areas in drug abuse research, and 4) to provide an interdisciplinary educational environment for students and faculty interested in various areas of drug abuse research. The philosophy of the Research Center is that drug abuse is a complex problem which needs to be studied on a variety of levels ranging from a drug's sub-cellular actions through its sociological impact. It is impossible for any single department, let alone an isolated individual, to possess the expertise to study drugs at all these levels. The Research Center has been to provide a formal structure for encouraging interaction between scientists and clinicians from several academic departments, all of whom are working in areas related to drug abuse. Current research includes: studies of drug self-administration in infra-human primates as well as man; studies of the sensitivity of current and former methadone dependent humans to alcohol and amphetamines; neurochemical studies of drugs of abuse; metabolism of drugs of abuse in animals and man.

LONGITUDINAL STUDY OF TEENAGE AND YOUNG ADULT DRUG USE

G.M. Smith, Massachusetts General Hospital, *32 Fruit St., Boston, Massachusetts* 02114 (R01 DA 00065-09)

Our objective is to study antecedents and sequelae of drug use among teenage students and young adults by analyzing a comprehensive, 13-year longitudinal data base collected from 2,500 subjects. Those subjects were in grades 5-10 when our study began in 1969. Between 1969 and 1976, measures were obtained regrading use of illicit drugs, alcohol, and cigarettes; attitudes toward and knowledge about drug use and drug users; attitudes toward cigarette smoking and cigarette smokers; personality; grade point average; school attendance; and school suspensions. Follow-up studies to be performed by mailed questionnaire during 1979-1982 will collect information regarding post high school substance use and significant life events. Topics covered will include current and past use of illicit drugs, alcohol, and cigarettes; education and work experience since high school; social and family adjustment; health and hospitalizations; accidents; attitudes; life satisfactions; personality; interpersonal relations; and deviance.

MAINTENANCE OF THE DAEDAC DATA BASE

S. Sells, Texas Christian University, Inst. of Behavioral Research, *P.O. Box 29010a, T.C.U. Station, Fort Worth, Texas* 76129

The Drug Abuse Epidemiology Data Center (DAEDAC) is a research archive of studies and original data files. In the early stages, DAEDAC acquisitions were confined mainly to studies concerning incidence, prevalence, morbidity and mortality associated with the use of illicit drugs. Since its inception in November 1973, DAEDAC has developed into an extensive and richly endowed data source for research and information on the epidemiologic and social science aspects of drug abuse, illicit and licit, in the U.S. with an international component being added in 1979. To be comprehensive and current, it is necessary to continually build upon the existing files with new data and studies. The DAEDAC maintains two types of files: The Original Data File and the Aggregate File. The Original Data File contains coded raw data from original drug surveys, evaluation studies and drug abuse epidemiology studies. The Aggregate File is a computerized file of research literature containing bibliographic citations, summaries and data tables coded from research reports, studies and journal articles on drug abuse. The objectives of this contract are: a. Acquisition, preservation and maintenance of original drug abuse data files; b. Organization and documentation of data files to facilitate secondary analysis; c. Acquisition and maintenance of a library of research reports of special interest to professionals and administrators working in the drug abuse field; d. Development and maintenance of a computer file with retrieval software to provide bibliographic citations, statistical tables, and abstracts concerning drug abuse problems addressed in the research literature; e. Provision of data, analyses, bibliographies, special reports, and other information based on archive holdings to NIDA staff in response to specific research and technical questions; f. Development of a report describing DAEDAC and its holdings; g. To provide for uninterrupted operation of the DAEDAC archive; and h. To provide for the transfer of the DAEDAC archive, including files, software, documentation and

the library of reports to any group or organization as selected by NIDA.

CENTER FOR SOCIOCULTURAL RESEARCH ON DRUG USE--PROGRAM
E. Josephson, Columbia University, School of Public Health, Dept. of Sociomedical Sciences, *600 W. 168th St., New York, New York* 10032 (P01 DA 01097-07)
The objectives of this program project are to contribute to understanding of the factors associated with initiation into drug behavior, changes in that behavior, and the consequences of such behavior, especially in the period between adolescence and young adulthood, and to understanding of national, cultural and ethnic differences in drug behavior and the societal responses to that behavior. To achieve those objectives, two follow-up studies have been initiated (Kandel's follow-up, nine years after initial contact with them, of a representative subsample of former 10th and 11th grade high school students and of absentees in New York State, and Comitas' cross-national comparison of the consequences of cannabis use in several cultures where earlier ethnographic studies had been done); two new studies have been started (Lukoff and Brook's study of personality, peer and family influences on the onset, development and consequences of drug use among adolescents of high school age, and Josephson's study of drug policy with particular reference to recent changes in U.S. policy regarding marijuana); and further analysis of data collected earlier has been undertaken (Kandel's cross-national analysis of factors associated with adolescent drug use, based on comparative studies conducted in France and in Israel in 1977-78, Lukoff and Kleiman's analysis of the life cycle of treated heroin addicts, and Brunswick's analysis of longitudinal data on the effects of drug use on the health of young black adults).

IMIPRAMINE TREATMENT OF DEPRESSED METHADONE PATIENTS
H.D. Kleber, Addiction Prevention Treatment Foundation Inc., *98 Park St., New Haven, Connecticut* 06511 (R01 DA 01660-04)
Following a three-year survey of the prevalence of depression in methadone maintained patients, the Depression Unit and the Drug Dependence Unit began a collaborative, double-blind, randomized trial of imipramine in the treatment of acutely depressed patients. This proposal requests additional funds in order to complete the intake and treatment phase of the clinical trial; to conduct a six-month and one-year follow-up of patients involved in the treatment phase; and to complete data analysis of both the treatment and follow-up phases. The objectives of the follow-up are to ascertain the clinical course, symptoms and social functioning outcomes following the research treatment; determine enduring effects of the treatment, both immediate and delayed; measure intercurrent events and help-seeking patterns following the treatment, determine patient expectation, satisfaction and perception of the treatment, and determine any negative effects of introducing a potential drug of abuse to a drug dependent population.

INHALANT ABUSE AMONG YOUNG NATIVE AMERICANS
E.R. Oetting, Colorado State University, School of Natural Sciences, Dept. of Psychology, *Fort Collins, Colorado* 80523 (R01 DA 01853-03)
This project is a continuation of a series of studies examining the extent and nature of drug abuse among American Indian young people. Data are collected by anonymous surveys administered in reservation school. Two survey forms are used--one for 4th-6th graders and another for 7th-12th graders. Special areas of research interest include: 1)Instrument development; 2) Inhalant abuse; 3) PCP abuse; 4) Longitudinal data to determine precursors of drug use; 5) Community characteristics predictive of extent and pattern of drug use; 6) Trends in drug use over time; 7) Patterns of spread of drug use.
In addition to exploring the above areas of research, detailed reports of drug use patterns are provided to the participating schools.

U.S.-MEXICO PROGRAM OF RESEARCH IN INHALANT ABUSE
M. Korman, University of Texas, Health Science Center at Dallas, Graduate School of Biomedical Sciences, Dept. of Psychology, *5323 Harry Hines Blvd., Dallas, Texas* 75235 (R01 DA 01977-02)
This investigation proposes to study various groups of U.S. and Mexico inhalant users in a series of joing and related studies focusing on young adults. We aim to: 1) Complete an ethnographic study of inhalant use consisting of (a) an analysis of individual users; b) an analysis of the social context; (c) an analysis of the institutional framework which interfaces with inhalant users. 2) Evaluate the relationship of inhalant use and aggressive behavior; investigate aggressive responses in relationship to such variables as degree of frustration, range of coping strategies available, degree of impulsivity. Examine a number of personality variables to assess underlying psychological mechanisms. 3) Investigate the relationship of the development of tolerance for inhalants to patterns of inhalant use. 4) Describe the extent of psychological dependence upon, and commitment to inhalant use. Relate to sex and ethnic differences. 5) Quantify the extent of physical dependence upon inhalants and relate to patterns of use; chart clinical picture of withdrawal. 6) Evaluate biomedical and neuropsychological status of heavy inhalant users in comparison to other drug users.

SUBSTANCES ABUSE - SPONTANEOUS ABORTION & FETAL DEFECT
Z.A. Stein, New York State Psychiatric Inst., *722 W. 168th St., New York, New York* 10032 (R01 DA 02090-02)
An epidemiologic, cytogenetic, and pathologic study is being carried out to examine the relation of spontaneous abortion and fetal anomalies to use of alcohol, aspirin, heroin, methadone, marijuana and tranquilizers. Substances which are associated with spontaneous abortion will be identified through a comparison of exposure histories among women with spontaneous abortions (cases) and among women who deliver after 28 weeks gestation (controls). The mechanisms underlying the associations between specific substances and spontaneous abortions will be elucidated through a comparison of the karyotypic and morphologic characteristics of the conceptions of exposed and unexposed parents. Further understanding of fetal pathogenesis will be obtained through examination of selected characteristics of the live births from the control series in relation to exposure.

EFFECT OF THC ON FEMALE REPRODUCTIVE PHYSIOLOGY
S.J. Gross, Receptor Research Inst., *218 N. Boyle Ave., Los Angeles, California* 90033 (R01 DA 02132-02S1)
The effects of marijuana on female reproductive physiology are unknown. Although some animal studies indicate a variety of neuro-endocrine abnormalities and possible teratogenicity, no controlled study has been reported in humans. Since quantitative assessment to support anecdotal information is now possible by our separate assays for delta 9-THC, the psychoactive ingredient of marijuana, and its metabolites, we have undertaken a prospective study of the effects of marijuana on women.
Female marijuana users (250 pregnant and 1000 non-pregnant) will be compared to non-user groups. Menstrual irregularities and other abnormalities of reproductive physiology will be investigated in non-pregnant females. Antepartum, labor, delivery and neonatal problems will be compared in marijuana users and matched controls.
The newborns will be analyzed by normal pediatric milestones for at least 18 months.
In all phases of the work, anecdotal clinical data will be weighed against accurate laboratory measurements. The results should permit an unbiased evaluation of immediate and long-term marijuana effects on female reproductive physiology.

SUBSTANCE ABUSE AMONG HYPERACTIVE BOYS AT ADOLESCENCE
J.P. Loney, University of Iowa, School of Medicine, Dept. of Psychiatry, *Jessup Hall, Iowa City, Iowa* 52240 (R01 DA 02134-02S2)
This is a supplement to a comprehensive longitudinal study of substance abuse in: (1) a sample of 135 hyperkinetic boys referred for outpatient psychiatric evaluation between 1967 and 1972, treated with CNS stimulant drugs and followed up at adolescence between 1973 and 1975; and (2) a sample of 100 hyperkinetic boys referred for outpatient psychiatric evaluation between 1973 and 1978, not treated with a CNS stimulant drug, and followed up at adolescence between 1978 and 1981. third sample of 50 hyperkinetic boys referred between 1973 and 1978, but treated with a CNS stimulant, is also being followed up at adolescence between 1978 and 1981.
The supplementary investigation will duplicate the adolescent follow-up battery in 100 randomly-selected classmates of the non-medicated hyperkinetic boys and 50 randomly-selected classmates of the concurrent medicated hyperkinetic boys, thus providing normative comparison groups. The present study will answer questions and the prevalence, predictors, and patterns of substance attitudes and use in drug-treated and non-drug-treated hyperkinetic boys and in their classmate controls.

PATTERNS OF COCAINE USE - AN INTERDISCIPLINARY STUDY
P.J. Cleckner, University of Miami, School of Medicine, Dept. of Psychiatry, *1400 N.W. 10th Ave., Box 520875, Coral Gables, Florida* 33152 (R01 DA 02144-02)
A number of concerns have arisen about the rapid increase in cocaine use in the United States. The overall purpose of this study is to examine this problem and to investigate how social and cultural factors influence drug use in general and cocaine use in particular.
Specifically, this project is investigating sociocultural variations in cocaine use patterns in Dade County, Florida. An interdisciplinary approach which combines both theory and method of sociology and anthropology is being employed.
The particular aims of the study, which are designed to fill gaps in the recent cocaine research, include: 1. The development and refinement of a typology of cocaine use patterns. 2. A comparison of the cocaine use patterns employed by Black, Cuban and White members of tri-ethnic population, and by male and female groups. 3. A comparison of cocaine use patterns of users in drug treatment programs with the patterns of cocaine users in the community who have never been in treatment. 4. An investigation of social control and social learning factors which may influence the stabilization of cocaine use at a particular level or use pattern.
During the first year of the project, 192 cocaine users will be interviewed and these data will be computerized. During the second year extensive analysis

will be conducted. In addition, 48 respondents will be interviewed in detail.

A PANEL STUDY OF ADOLESCENT SUBSTANCE ABUSE CAREERS

E.R. Morrissey, University of Washington, Alcoholism & Drug Abuse Inst., *Seattle, Washington* 98195 (R01 DA 02151-03)

This research is a continuation of a project consisting of a follow-up of 1473 adolescents who have been previously interviewed regarding drug and alcohol use patterns and related problems. The project will isolate factors which contribute to the development of substance abuse problems in late adolescence and to their persistence into early adulthood. All of the high risk subjects, originally contacted when they were referred for alcohol counselling or held in juvenile court detention, are being interviewed in the follow-up study. The treatment agencies in which the baseline data were collected will cooperate in recontacting their clients.

Four specific sets of factors will be examined as predictive of stable heavy alcolol and drug intake and of the development of resultant problems. Independent variables hypothesized to relate to substance abuse outcomes are: (1) prior psychiatric diagnoses; (2) seriousness of deviant history; (3) initial levels of substance intake and related problems and (4) sex role attitudes and behaviors. The effects of these independent variables will be examined controlling for the type of intervention to which the youths were initially subjected, and for demographic characterisics.

An assessment of the effects of these variables will allow for: (1) an evaluation of the relative importance of psychiatric and social histories in the development of symptoms of alcoholism or drug abuse in early adulthood; and (2) the establishment of psychiatric diagnostic criteria for alcoholism and drug abuse which will be useful in screening youthful populations.

THE PHENCYCLIDINE USER - A LONGITUDINAL STUDY

D.B. Graeven, California State University & Colleges, California State University, Hayward Campus, School of Arts Letters & Social Sciences, Dept. of Sociology, *25800 Carlos Bee Blvd., Hayward, California* 94542 (R01 DA 02293-02)

This study involved interviews with 200 phencyclidine users. The research design included interviews with heavy and lighter chronic users as well as a group of recreational users. Respondents were obtained through local drug using contacts and snowball sampling techniques were used.

The objectives of the research are to: 1) examine patterns of use and change in use patterns, 2) describe the perceived motivation for use, reason for quitting, and perceived effects of phencyclidine, and 3) determine health and behavioral changes in the user that are related to phencyclidine use. Data analysis will begin in March, 1980.

3.0353,

SEROEPIDEMIOLOGY OF PARASITIC DISEASES - IMPROVEMENTS IN METHODOLOGY, SKIN TEST, CONSULTATION, AND FIELD STUDIES

H.M. Mathews, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., Parasitology Division, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/P-0010)

PROJECT DESCRIPTION: Epidemiologic techniques are used to measure intensity and distribution of parasitic diseases and to evaluate the effect of control treatment. The detection of specific antiparasitic antibody in human sera is a good method for assaying the prevalence of parasites in a population, particularly where etiologic diagnosis is difficult, time consuming, or unrewarding as in malaria, amebiasis, toxopiasmosis, chagas' disease, and schistosomiasis. A skin test antigen for schistosomiasis is prepared and provided to the Peace Corps and physicians on request for this reagent. This project will attempt to improve detection systems for greater sensitivity and specificity, using newly developed tests such as ELISA and countercurrent electrophoresis. The results of the project will provide medical and public health authorities in the United States and developing countries a more accurate picture of the prevalence of parasites in their populations. The overall goal is the utilization of efficient means of disease control detection devices by public health authorities.

FIELD AND LABORATORY STUDIES OF PLAGUE ECOLOGY

A.M. Barnes, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., Vector Borne Diseases Division, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/VBD-0108)

PROJECT DESCRIPTION: Field and laboratory studies are conducted to identify key reservoir and vector species involved in the epizootic amplification of plague and related zoonoses and their transmission to man. Ecological factors and interactions among vectors, pathogens, reservoirs, and other elements of the environment will be studied and defined in terms of human risk, using key factor analysis to isolate and define viable educational, environmental, and chemical approaches to the prevention and control of plague and related disease.

HOST-PARASITE RELATIONSHIPS, IN VITRO CULTIVATION OF PARASITIC ORGANSISMS, AND IMPROVEMENTS IN IMMUNODIAGNOSIS OF PROTOZOA

G.S. Visvesvara, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., Parasitology Division, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/P-0006)

PROJECT DESCRIPTION: Protozoan diseases, such as amebiasis, giardiasis, amebic meningoencephalitis, malaria, and pneumocystis, cause a great deal of morbidity and, occasionally, mortality throughout the world. Many aspects of the epidemiology and host-parasite relationship of protozoan parasites need to be clarified. New methodology for the cultivation of parasitic protozoa is needed for the production of specific antigens for serodiagnosis. The specific diagnosis of these diseases needs to be improved. In vitro axenic and polyxenic cultivation and in vivo animal experiments to prepare antigens and to evaluate new diagnostic procedures are being done. The goal of these studies is to increase our understanding of parasitic diseases and improve techniques with which to better organize resources for their identification and control.

PROSPECTIVE POPULATION-BASED STUDY OF SCHISTOSOMA MANSONI (BOQUERON)

E. Ruiz Tiben, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., San Juan Laboratories, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/SJL-0005)

PROJECT DESCRIPTION: The long-term community study of infection with Schistosoma mansoni in Parcelas de Boqueron terminated after the last annual survey conducted during January-April 1980. Egg output by the infected community residents was quantitated as in previous years. Analysis of data suggests that adult S. mansoni worms in this population have a half-life greater than 10 years - much longer than previously believed. Clinical morbidity attributable to infection with S. mansoni was reassessed among a cohort of individuals first examined in 1975. population-based double-blind trial to evaluate the safety and efficacy of oxaminiquine as an anti-schistosomal drug was conducted in outpatients in Boqueron during June 1980.

COLORADO TICK FEVER STUDIES

R.G. McLean, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., Vector Borne Diseases Division, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/VBD-0104)

PROJECT DESCRIPTION: Surveillance of Colorado tick fever (CTF) includes diagnostic testing of approximately 300 suspect patients. Detailed studies of the pathophysiologic effect of CTF infection are being made on 4 to 6 patients annually. Ecologic and epidemiologic studies to evaluate the risk of human exposure to CTF include evaluation of (a) type of camping activities which results in acquisition of vector ticks, (b) chances of developing CTF among defined camper populations, and (c) the level and natural history of CTF infection in mammal and tick hosts in defined recreational areas. Approximately 25 strains of CTF virus from different hosts and geographic regions are being analyzed for variations in antigenic and genetic characteristics.

STUDIES ON MONKEYPOX AND OTHER DISEASES TO DETERMINE THEIR INFLUENCE ON PUBLIC HEALTH SITUATION AFTER SMALLPOX IS ERADICATED (ABBREV)

J.H. Nakano, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., Virology Division, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/V-0025)

PROJECT DESCRIPTION: Since 1970, 36 cases of human monkeypox have been detected in west and central Africa. Although monkeys and other animals in the vicinity of human monkeypox cases were found to have vaccinia antibodies, monkeypox virus has been isolated from a free-living wild animal. Also, a pox-virus has been isolated from organs taken from two rodents and two nonhuman primates during the course of field studies near human monkeypox cases. The viral isolants have been called 'whitepox' virus and are indistinguishable from variola virus by the laboratory tests now used. The purpose of the study is to continue the surveillance of smallpox-like disease due to monkeypox and other poxviruses in humans and, eventually, to determine the natural history of monkeypox and related animal poxviruses (e.g., whitepox) by describing and indexing the fauna near cases of human poxvirus diseases and by identifying monkeypox and other animal poxviruses by serologic and virologic surveys of the selected animal populations. The study includes the determination of the biologic characteristics and the pathogenicity of newly discovered poxviruses.

BIOLOGY AND IMMUNOLOGY OF SCHISTOSOMA MANSONI

E. Ruiz Tiben, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., San Juan Laboratories, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/SJL-0017)

PROJECT DESCRIPTION: The life cycle of Schistosoma mansoni is maintained routinely in Bagg Swiss mice and Biomphalaria glabrata snails in the laboratory to provide material for the preparation of antigens and for training and demonstration purposes. The snail colony provides B. glabrata for the S. mansoni life cycle and for sentinel animal work. Promising new immunodiagnostic techniques and/or antigens are evaluated using the serum bank and extensive parasitological data back-up of the prospective study of S. mansoni infection in Parcelas de Bouqueron community. The circumoval precipitin test with S. mansoni eggs as antigen is utilized as the reference immunodiagnostic test.

SOUTH AMERICAN ARBOVIRUS STUDIES

T.P. Monath, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., Vector Borne Diseases Division, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/VBD-0103)

Cooperative studies in Equador and Argentina are designed to obtain information on the prevalence of human infection and disease caused by arboviruses of public health importance in the United States and which are known to occur in these two countries. Arthropods and vertebrates are being studied to determine those hosts responsible for virus persistence and periodic epidemic-epizootic transmission. Similarities and differences in endemicity and disease occurrence for St. Louis, western, eastern, and Venezuelan equine encephalitis viruses in the United States and these two neotropical countries are contrasted. These cooperative studies also provide the basis for training and the establishment in South America of additional competent public health scientists to conduct studies of arboviral problems.

ST. LOUIS ENCEPHALITIS AND RELATED FLAVIVIRUS STUDIES

D.W. Trent, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., Vector Borne Diseases Division, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/VBD-0106)

These studies are designed to evaluate the role of virus and host variation in determining the different geographic and ecologic patterns of St. Louis encephalitis and related flaviviruses. The natural variation of flaviviruses is being evaluated by analysis of genetic, pathobiologic, and immunologic factors. Geographically and ecologically representative virus strains are being evaluated with respct to intrinsic factors of virus structure, molecular biology, pathogenicity, vertebrate host specificity, and types of host immune responses. Substructural viral elements are analyzed by immunochemical methods. These studies will provide information to explain the absence of SLE epidemics in tropical America, the milder appearance of the disease in the far western U.S. and will elucidate the viral genetic factors which modulate virulence.

ENVIRONMENTAL STUDIES OF SALMONELLA, LEGIONNAIRES' DISEASE BACTERIA, AND OTHER PATHOGENIC BACTERIA

W.B. Cherry, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, Bureau of Lab., Bacteriology Division, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333 (CDC/BL/B-0130)

A major gap in our knowledge of Legionnaires' Disease epidemiology is the source of the etiologic agent and the mechanisms by which human infections occur. This information is essential for the disease prevention and control. We are investigating possible environmental sources of the organism and defining the conditions under which the bacteria survive or multiply. Environmental strains are compared with human strains in respect to morphological, cultural, biochemical, serological, and pathogenic attributes. We are also studying the serological relationship of the legionella to other water and soil bacteria that may be isolated and the ability of salmonella and arizona to survive as free-living organisms on the surfaces of living vegetation. We are also developing better methods for isolation and detection of salmonella from water. Salmonellosis is a major public health problem, with an estimated 2 to 2-1/2 million cases per annum in the U.S., many of which are related to water contact.

3.0366,

MORTALITY, MEDICAL, AND REPRODUCTIVE STUDY OF LEAD WORKERS

S. Leffingwell, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-W21-553)

MORTALITY STUDY OF LEAD WORKERS: Lead phosphate administered subcutaneously to rats has resulted in the induction of renal tumors. Renal tumors in rats have also been induced by lead acetate-containing diet. Lead oxide appears to act synergistically with benzo(a)pyrene in pulmonary tumorigenesis in Syrian hamsters, since lead is reportedly cumulative in the lung. Workers in lead smelters and battery plants may breathe or ingest lead as a result of poor work hygiene practices. Possible carcinogenic or co-carcinogenic effects deserve examination. Although the authors of a study concerning carcinogenesis among lead battery plant workers concluded that their results do not support a specific cancer risk, the data indicate that such a risk may be present. In order to further assess the possible excess cancer risk related to lead exposure, a further retrospective cohort study is planned on workers exposed to lead and its compounds. A contract for establishing a master file and doing follow-up was given to Westat, Inc. The cohort has been identified and follow-up is under way.

REPRODUCTIVE STUDIES: Since as early as the mid 1800s, the effects of lead exposure on human reproduction have been observed. In 1860, Constantin Paul collected case histories on the reproductive effects in both male lead workers and their wives and in women workers who have had exposure to lead. Recently, Lancranjan et al, (1975), in a study of 150 male lead battery plant workers found that those in groups strongly affected by lead exposure had 'decreased fertility due to anthenospermia (reduced viability of sperm), hypospermia (both reduced numbers), or teratospermia (malformed), frequently associated.' All these reports suggest effects of lead on reproduction through both male and female exposure. Two reproductive history studies are being done, one to examine the effects on the male, and one to examine the effects on the female worker. Most of the data for the study of male workers have been collected, coded, and prepared for analysis. The study population for the study of effects of lead exposure on women workers has not yet been selected. Due to external delays, and due to limited personnel at NIOSH, this study will be postponed one year. (Text Abridged.)

MORBIDITY & INDUSTRIAL HYGIENE STUDY OF FIBROUS MINERAL WORKERS - NCI

J. Gamble, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKL-C21-237)

Industrial hygiene and medical examinations of all talc facilities have been completed. All raw data has been received, and analysis and reports are being written. Preparations have begun for industrial hygiene examinations of the attapulgite clay industry.

FROM LAST FY'S EXECUTIVE SUMMARY: Exposure to asbestos has long been recognized as being associated with pulmonary pathology. Due to this demonstrated carcinogenicity, industry has begun utilizing materials other than asbestos in their processes. These substitute materials, however, are similar to asbestos in their morphology and chemical/physical properties.

While a great deal of health research exists about asbestos, insufficient evidence exists on the pernicious effect of the substitute materials on the respiratory system. A thorough investigation is warranted to ascertain the resultant exposure to these substitute materials.

Concentrating on talc but studying other fibrous minerals as well, representative samples of those exposed to these materials in production or secondary use will be studied through the use of questionnaire, x-ray and measurement of respiratory function. The results will be coordinated with industrial hygiene surveys at the places studied.

Studies on workers involved in attapulgite clay deposits to be finished in FY 80.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $20,900

3.0368,

MORBIDITY AND IH STUDY OF WORKERS EXPOSED TO SULFUR OXIDES AND NITROGEN OXIDES

J. Gamble, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (033009TICNO)

The purpose of this study is to develop dose-response relations of both an acute and chronic nature for the various species of sulfur and nitrogen compounds in support of health standards development. The two essential interdependent parts of this study are the measurement of dose and of response. A measure of environmental dose will be obtained by personnel sampling for the compounds under investigation. Measurement of worker response include a questionnaire on demographic variables and respiratory symptoms, chest x-rays, and pulmonary function. A sample of the workers will be tested before and after work for changes in pulmonary function. Environmental measures will be taken concurrently. Levels of exposure that produce chronic effects will be estimated from total work history and environmental sampling at the time of the medical survey. Data collected from 5 salt mines showed a slight association of changes in pulmonary function over the shift with NO2 concentrations. Data from over 200 workers exposed to H2SO4 mist and controls is now being analyzed. Data on over 300 workers exposed to diesel exhaust has been collected.

3.0369,

MORTALITY AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO DYES - NCI

M. Haring, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C21-558)

In response to public and congressional concern about the carcinogenicity of chemical components of oxidative and 'coal tar' hair dyes, the IWSB reviewed the possibility of investigating the mortality experience of cosmotologists; however, an extensive review of records from state licensing bureaus and national cosmotologists organizations found the available data inadequate to conduct a comprehensive epidemiological or industrial hygiene study of cosmotologists as an occupational group.

Another occupational group exposed to oxidative dyes includes animal fur dyes. Since the turn of the century, furriers have been using phenylenediamine in their dyeing processes (the same chemical used as an intermediate in hair dyes). Therefore, the IWSB has jointly undertaken with NCI a retrospective cohort mortality study of fur dyers in New York City area.

The records of the Joint Board of the Fur, Leather and Machinists Workers Union (FLM) have been chosen as the principal data source. Due to the restricted nature of the records, the study was limited to retirees (pensioners) on whom the most complete documentation was kept. Follow-up for the cohort is continuing, mainly through the Social Security Administration.

A second union, Local 3 of the Fur Floor Workers Union has been contacted for possible inclusion in the study. A records assessment determined the local to be an excellent data source for a mortality study of all workers including active, terminated and retirees. Their data on retirees could be used to supplement those of the FLM due to the similarities in ethnic background, geographical location of the shops and jobs performed.

3.0370,

MORTALITY, MEDICAL, AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO TOLUENE - NCI

F. Stern, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C21-636)

Recently, toluene has received much attention for its potential long term health effect due to occupational exposure. TSCA (Toxic Substance Control Act) has listed toluene for further study, and CIIT (Chemical Industry Institute for Toxicology) has listed toluene as a first priority for study.

Toluene is a chemical of major use in U.S. industry today. In 1970, it was estimated that 694 million gallons of toluene were produced and approximately 100,000 workers were potentially exposed. In addition, it is expected that toluene will be substituted for benzene in many industrial processes.

Investigators have noted the acute toxic properties of toluene which include effects on the nervous system, liver, blood cells and chromosome changes. Of specific interest, exposed workers have exhibited depressed erythrocytes, hepatomegaly, macrocytosis, and chromosome breaks and aberrations. Furthermore, chromosome changes have also been noted in exposed rats.

The current federal standard is 200 ppm as an 8-hour TWA with an acceptable ceiling level of 300 ppm and acceptable maximum peaks above the ceiling of 500 ppm are allowed for 10 minute durations. However, controlled exposure of human subjects to 200 ppm for 8 hours produced mild fatigue, weakness, confusion, lacrimation, and paresthesias. Since chronic exposures may cause damaging effects, NIOSH has recommended a limit of 100 ppm (TWA) with a ceiling of 200 ppm for a ten minute sampling period.

This project will involve a retrospective cohort mortality analysis of an occupational population to determine whether or not there are any long term chronic health effects from toluene exposure. The first phase of the investigation will be a feasibility study to determine extent of exposure, to characterize the work enviornment, and to assess the feasibility of conducting the mortality portion of the study. A plan for a cross-sectional medical study is also being proposed.

During FY 79, walk-through surveys of labeling, adhesive, and shoe manufacturers were conducted where toluene is used as a major solvent.

3.0371,

OCCUPATIONAL DISORDERS OF THE WRIST

D. Habes, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOK-G24-282)

Information obtained during the last three years by NIOSH indicates that hand and wrist disorders such as carpal tunnel syndrome and tenosynovitis resulting in medical treatment, absenteeism, and reassignment occur with high frequency, particularly among female workers. Jobs requiring repetitive motions of the hands and arms and those requiring high finger and wrist forces while in awkward hand and arm positions have historically been associated with these kinds of disorders.

In FY 80, techniques developed under a NIOSH sponsored grant (An Investigation of Occupational Wrist Injuries in Women, #2R01 OH00679-04) will be used to study high risk jobs identified in FY 79. Frame-by-frame analysis of films of jobs, electromyography, and sensory and motor ability tests are examples of the measures that will be implemented to identify and analyze hazardous elements of these jobs. PEB will utilize a consultant to develop the capability to perform such evaluations.

Further, different high incidence industries will be studied on a free-for-service basis using the methods described. The feasibility of conducting long term in-plant evaluations of intervention strategies such as work methods and tool design and worker evaluation will also be determined from these individual plant studies.

In FY 79 efforts were limited to identifying high risk jobs which need to be studied. Upholstery stitchers, small engine and small appliance assemblers, and electronic component assemblers were among the highest incidence jobs found and constitute the Population at Risk.

Ultimately, this work will lead to a safety and health guide for jobs involving a high risk of hand and wrist musculoskeletal disorders.

3.0372,

NEUROBEHAVIORAL INTERACTIONS OF SPRAY PAINT AGENTS

V. Putz, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOB-B24-272)

Chemicals found in spray painting such as solvents, alcohols, aliphatic and aromatic hydrocarbons have typically been evaluated for their toxicity on an individual basis. Yet exposures in this operation involve more than one agent. The intent of this project is to investigate possible interactive effects of select chemicals found in spray painting utilizing neuro-behavioral response measures. The population at risk is approximately 400,000 spray painters. Two separate investigations, using human test subjects, are planned: (1) An in-house laboratory study of the behavioral and neurologic effects from various single and combination inhalation exposures to toluene and methyl-ethyl-ketone plus ingestion of ethyl alcohol. The resulting interaction study will focus on work activities of spray painters which involve general alertness, eye-hand coordination and timing. During FY 79, preparatory work was completed for subject testing. (2) A contract field study of the neurobehavioral effects on spray painters of chronic inhalation exposures to solvents found in paint sprays. Work places involving spray painting and a comparable, but non-exposed control population will be identified. Suitable psychoneurobehavioral tests will be administered. Specific solvents will be identified in the spray paint work environment and appropriate air samples will be obtained. Biochemical body-burden indicators will be obtained along with health and work histories to provide data on the extent of the chronic exposures.

CONFERENCE ON SHIFT WORK AND HEALTH

M. Colligan, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOB-B21-273)

During FY 79, a conference involving more than 40 international scientists representing 10 countries was held in conjunction with the the Office of Naval Research (IA-79-10) to examine the effects of variations in work-sleep schedules on health and performance. Shift work (particularly rotating shift schedules) and extended working hours were shown to disrupt individual circadian rhythms, sleep/restfulness cycles, and family adjustment. Contributed papers and discussions at this conference offered the most comprehensive multidisciplinary view of the state of art regarding the health and safety consequences of shift work currently available. Work on this project during FY 80 will consist of preparing the Conference proceedings for publication. The proceedings document is slated to be published as a NIOSH report during the Summer, 1980.

REGISTRATION OF DISEASE AND EXPOSURE COHORTS

J. Salg, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-C11-625)

The Illness Effects Section (IES) currently maintains or is developing a number of disease (angiosarcoma of the liver, berylliosis) and exposure (kepone, OSHA-regulated carcinogens, DBCP) registers. The relative importance of each register differs given program or scientific considerations. The purpose of the project incorporates three major objectives: (1) Develop a common Data Management Structure. Each disease and exposure register has similar requirements for maintenance and technical administration. We propose to standardize the various activities associated with the collection, maintenance, and utilization of the IES register-based data. (2) Edit and Update existing computer-based data files. The independent development of the registers necessitates a complete edit of the current data files. Supplemental information will be obtained, consistent with the standardization mentioned previously. (3) Support the Development of the DBCP Register. The IES contributions to NIOSH associated activities with the DBCP episode were programmed as support to HETAB during FY 78. The IES commitments for future activities during FY 79 and FY 80 require an independent administrative and technical accounting. Activities are outlined for the 2-year period October 1, 1978, through Sept. 30, 1980. Although proposed as a 2-year program effort, the prospective direction of Disease and Exposure Cohort Registration assumes an administrative and technical commitment to continuous monitoring.

FY 79 Accomplishment: DBCP - A master file was created and vital status ascertainment has begun. BCR - The Beryllium Case Registry contract has been awarded and plans instituted for an audit of the existing file.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $78,000

3.0375,

REGISTRY-BASED OCCUPATIONAL CANCER SURVEILLANCE - PHASE I

J. Sestito, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-C11-532)

The purpose of this project is the development of pilot efforts in population based occupational cancer surveillance. Prospective surveillance of the population and its occupational and industrial subpopulations is necessary to both (a) identify high risk populations and (b) follow-up known occupational and industrial sub-groups which are an unusually high risk of cancer occurrence. The former element relates directly to NIOSH's program of Industry-wide Studies. The early identification of 'suspect' occupational or industrial group assists in establishing priorities for future occupational studies. The follow-up of known or suspect groups seeks to verify and extend findings from initial surveillance and industry-wide study efforts. This sequence of early identification, industry-wide study, and prospective follow-up impacts directly on both criteria development and OSHA standards development.

FY 79 ACCOMPLISHMENTS: The Project protocol has been developed, reviewed, and modified. The Federal Reports Act clearance for the project's questionnaire was initiated.

3.0376,

ASSOCIATION OF PARENTAL OCCUPATION WITH CHILDHOOD CANCER CASES - NCI

R. Spirtas, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-W11-640)

Current studies of the association between industrial agents and reproductive effects have focused on health outcomes prior to and including delivery. For those pregnancies resulting in 'normal' live births, it is possible that later (after one year) adverse effects such as neoplasms could be directly associated with exposures from agents identified in the occupational/industrial groups of the mother and/or father of a child.

The purpose of this proposed project is to survey childhood cancer cases in an attempt to provide an overview of associations between certain malignant neoplasms and parental occupational/industrial groups and to suggest studies of specific occupational/industrial groups that indicate excess cancer risk for workers' offspring.

The work on the project would be carried out under contract. The contractor would abstract, code, and analyze a data set of childhood cancer cases to accomplish the define purposes of the project.

FY 79 ACCOMPLISHMENTS: An interagency agreement between the Food and Drug Administration and NIOSH was completed.

ACCESS TO NIOSH DATA BASE - INFORMATION PROFILE DEVELOPMENT - NCI

J. Seta, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluation & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-C11-632)

The NIOSH data base continues to provide important inputs to a wide spectrum of data users. It functions as a locator file for occupational groups at risk due to potential exposures. It also produces national estimates of numbers of workers potentially exposed to any of more than eight thousand chemical and physical agents.

This project supports the development of information profiles from the data base for chemicals, occupations, and industries.

MEDICAL AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO ADRENOCORTICAL STEROIDS

W. Halperin, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-G21-628)

A number of adrenocortical steroids are being manufactured in the United States by a number of drug companies. These steroids are extremely potent drugs. They have been shown to produce a number of detrimental effects in patients receiving them. These effects include hypertension, elevated blood sugar, acne osteoporosis, hirsutism, menstrual difficulties and other changes. From our preliminary studies of workers exposed to estrogen preparations, we know that effects are occurring in workers exposed to these potent hormones. A study reported with British Medical Journal has demonstrated adrenocortical suppression in workers manufacturing a synthetic glucocorticoid. The authors of this study believe that workers involved with manufacturing synthetic steroids are a risk despite their adherence to recommended precautions.

A cross-sectional medical/environmental study is underway to determine if health problems are occurring in the manufacture of adrenocortical steroid preparations in this country. If health problems are demonstrated to be present, it is anticipated that the data obtained will be of considerable assistance in determining safe levels of exposure to these agents.

So far, manufacturers of dexa and betamethasone have been identified and each questioned about numbers of workers potentially exposed, etc. If a cohort cannot be identified for dexa- and betamethasone manufacturers of prednisone, the next potent class of steroids will be similarly approached.

MORTALITY, MEDICAL, AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO PCBS - NCI

B. Smith, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C21-545)

Polychlorinated biphenyls (PCBs) are a class of chlorinated aromatic hydrocarbons that are widespread in the environment, are highly stable, and tend to bioconcentrate in the food chain. Their current use is primarily limited to close systems in the electrical industry as insulating material in capacitors and transformers. Reports of adverse health effects in humans and animals accidentally exposed to PCBs, and the demonstration of carcinogenic effects in certain animals from certain PCBs, have necessitated an evaluation of the toxicology of this class of compounds. In laboratory animals, structural function changes in the liver have been noted as well as heptic tumor induction in certain species. Other documented effects have included gastrointestinal, endocrinological, hematological and embryotoxic effects. In humans, the syndromes of chloracne, and Yusho neonatorum have been extensively documented.

A determination of the health effects from exposure to PCBs is being assessed by (1) a retrospective mortality study of a cohort of occupationally exposed workers; (2) a cross-sectional medical survey of a cohort of currently employed workers; (3) a detailed industrial hygiene survey.

The mortality study is well under way; follow-up is near completion on the two study cohorts exposed to PCBs. The medical surveys have been completed and data analysis is in progress. The industrial hygiene surveys on all plants that were included in the mortality study and medical study have been completed.

3.0381,

CANCER SURVEILLANCE OF OCCUPATIONAL COHORTS IN A WESTERN SMSA - NCI

J. Sestito, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluation & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-C11-530)

This project proposes the examination of cancer incidence patterns among selected occupational cohorts in the greater San Francisco-Oakland SMSA. Numerous unions and collective bargaining organizations maintain data on constituent members. Given existing data on known and suspected carcinogenic hazards present in the environment of these cohorts, the existence and applicability of union data facilitates the study of the occupational cohorts for unusual cancer incidence. Linkage of data such as this with data on cancer incidence in geopolitically defined populations provides direct comparison of cancer risks for selected occupational groups. The results of such efforts will assist industry-wide studies in identifying groups at risk and thus encourage a

finer characterization of the occupational environment. These activities will benefit NIOSH programs in criteria document development and OSHA's program of standard setting. This particular project also explores the methodologic and technical problems associated with population-based cancer surveillance. The nature of the study necessitates a cooperative effort between the SEER participant in the Bay Area and NIOSH. A contract will be developed for basic data collection, update, edit, and preliminary analysis.

FY-79 accomplishments: Seven unions, representing 16 union locals or approximately 9400 individuals, have been identified for study. Data files are being constructed to facilitate cancer registry linkage and cancer incidence determination.

3.0382,
MORTALITY AND INDUSTRIAL HYGIENE STUDY OF NEW AGENTS - III - NCI

J. Oser, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C21-623)

Newly suspected hazardous agents are continually emerging. This project is designed to gather preliminary information, conduct preliminary and complete industrial hygiene surveys and to initiate epidemiological studies when possible. The industrial hygiene component of the studies will be contracted out for study of these new agents. Epidemiological evaluations will be conducted by inhouse personnel. The essentials of the study will be in three tasks: 1) develop protocol and review literature, 2) schedule and conduct initial field surveys, 3) schedule and conduct detailed industrial hygiene studies. Under the proposed contract three broad agent categories are assigned to the contractor for literature evaluations and recommendations as to specific agents within these categories for study. These agent categories are wood preservatives and two other agents to be named in FY 80. A 30-month contract has been awarded to Stewart-Todd Associates with a performance period from Sept. 28, 1978 to April 27, 1981. All of the work on wood preservatives has been completed in FY 79 except for the preparation of the final report and completion of in-depth surveys.

Two previous NIOSH contracts for similar studies have been awarded for studies of vinyl halides, epichlorohydrin, fluorocarbons, ethylene dibromide, ethylene oxide, toluene and zeolite.

3.0383,
MEDICAL, INDUSTRIAL HYGIENE, AND REPRODUCTIVE STUDIES OF WORKERS EXPOSED TO ESTROGENS

S. Tanaka, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-W21-605)

Estrogens are a group of synthetic and natural hormones having serious potential effects on exposed workers. NIOSH hazard evaluation studies which were carried out in chemical and pharmaceutical manufacturing plants indicated that male workers developed gynecomastia and female workers experienced intermenstrual bleeding. It has been documented that women taking oral contraceptives have an increased risk of thromboembolism, cerebral vascular disease, and myocardial infarction. It has also been noted that estrogens may be carcinogens (e.g., increased incidence of endometrial cancer among women on estrogen replacement therapy. DES is a transplacental carcinogen/teratogen to the offsprings).

A cross-sectional medical/industrial hygiene study has been initiated to study health problems of workers exposed to estrogens and to attempt to determine a safe level of exposure to these agents. During the second quarter of FY 79, a workshop was held (in lieu of the tripartite meeting) which was attended by representatives of the pharmaceutical manufacturing plants and a substantial amount of information was collected on manufacturing processes, employee profiles, etc. Five of these plants were selected for in-depth study; four of these manufacture oral contraceptives using synthetic estrogens and one proccesses conjugated estrogens of natural origin. It was also determined that there is no longer a plant in the U.S. which chemically manufactures DES in bulk and that pharmaceutical preparations containing DES are manufactured only sporadically. Because of this, it was decided that occupational effects of DES exposure will not be studied in this project. Feasibility determinations regarding the mortality study of workers occupationally exposed to products containing estrogens have been completed in all but one plant. The remaining company has been contacted and a walk-through survey date is being negotiated.

3.0384,
MEDICAL, REPRODUCTIVE, AND INDUSTRIAL HYGIENE STUDY OF EFFECTS OF EXPOSURE TO CS2

B. Albright, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-W21-569)

Carbon disulfide is used in the xanthation of cellulose to produce viscose rayon, as a solvent for sulfur or as a diluent for sulfur chloride in vulcanizing rubber, as a solvent for ribber cement, as an insecticide, as a solvent for phosphorous, fats, oils, resins, and waxes, in the manufacture of optical glass and is encountered in the destructive distillation of coal.

The toxicity of carbon disulfide (CS2) has been recognized for many years and generally is associated with central nervous system effects such as loss of memory, excessive irritability, vertigo, melancholia and in severe cases, dementia. More recent studies indicate an increase mortality and morbidity from cardiovascular disease and sexual impairment in both men and women.

The study of this agent has the following phases: 1. A study of mutagenesis by administering reproductive history questionnaire to the wives of workers. 2. A cross-sectional medical study to investigate the adverse health effects in workers exposed to carbon disulfide. 3. An industrial hygiene study to determine present CS2 exposure levels and estimate working lifetime exposures.

Data collection for the medical study and reproductive history has been completed. Industrial hygiene data collection was completed in the month of May, 1979. Percentage of worker participation in the medical study has been about 65%. Coding of the data began in May, 1979, and continued through FY 79.

MULTIPLE MYELOMA AND BRAIN TUMORS IN PHYSICIANS

G.M. Matanoski, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (R01 OH 00920-02)

Studying the etiology of these two cancers and their correlation in physicians, a relatively homogenous population which is unique in having a high probability of exposure to repeated low-dose radiation and infections and good medical histories. The design is a case-control study with controls comparable by age, race, sex, and year of death selected from total physician deaths over fifteen years. An equal number of living controls will also be selected. Risk factors identified in previous studies will be examined by telephone interviews with next-of-kin, physicians associates, or physicians if a case-control. There will be special emphasis on determining the exact number of years of exposure to radiation and the estimated dose levels by year or dosimetry data. Questions concerning patient contacts, personal characteristics and medical history will be included. Information on residence, type of training and specialty are available from AMA records. A multi-variate analysis of data will be used to determine association of each of these cancers with radiation, infection, or other factors.

3.0386,
OCCUPATIONAL HEALTH RISKS OF WORKERS IN ATOMIC PLANTS

T.F. Mancuso, University of Pittsburgh, Graduate School of Public Health, Dept. of Industrial Environmental Health Sciences, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (R01 OH 00929-02)

The purpose of this research is to determine the occupational risks among workers in an atomic energy facility. A major objective is to study the long-term delayed biological effects of low-level ionizing radiation in a normal adult industrial population, who have been chronically exposed to fractionated doses of low-level ionizing radiation over a span of years.

The study is a prospective epidemiological evaluation of workers employed since 1944 and in succeeding years to be followed for cause of death identification through 1979, in which known radiation measurements have been made and recorded on a uniform basis during the entire period of employment. The National Social Security System is utilized for the identification of the deceased and the state vital records provide the cause of death data.

A control population for the Hanford employees matched to the 35,000 atomic worker population has been established and will be processed simultaneously through Social Security with the employees for the identification of mortality data. Previous analyses have been confined to Hanford employees, 1976.

Successive cohort analyses of employee populations, with simultaneous control of employment exposures, employment patterns, occupations, and external and internal radiation measurements will be carried out.

MORTALITY EXPERIENCE OF WORKERS EXPOSED TO HALOETHERS

B.S. Pasternack, New York University, School of Medicine, Dept. of Environmental Medicine, *100 Washington Sq. E., New York, New York* 10003 (R01 OH 00932-02)

Chloromethyl-methyl ether (CMME) and bis-chloromethyl ether, an impurity (2-8%) in commercial CMME, are alkylating agents having diverse use in the chemical industry. Animal studies have demonstrated that both compounds are potent lung carcinogens. A retrospective cohort study of occupational exposure to CMME was initiated in 1972 to evaluate the human carcinogenicity of these compounds. The initial survey showed a clear excess of respiratory cancer among the CMME-exposed workers, and a strong exposure-response relationship. Other findings among the exposed workers were a considerable number of respiratory cancers at early ages (before age 45), an excess among both smokers and nonsmokers, and an inverse relationship between dose and respiratory cancer latency. Particularly because of the latter finding, another mortality survey is underway to better characterize the risk for those with lower exposure levels. The survey will include all seven major CMME producer and user firms in the USA for the time period 1948-1979. An estimated 2000 CMME-exposed workers and 3500 unexposed workers will be available for study.

THE ROLE OF ATOPY IN OCCUPATIONAL SKIN DISEASE

E. Shmunes, University of South Carolina, College of Health, *Columbia, South Carolina* 29208 (R01 OH 00954-02)

The objectives of this grant concern two areas. Regarding the role of atopy in occupational dermatitis the objectives are as follows: to demonstrate the incidence of atopy among the closed cases of Workmen's Compensation in the State of South Carolina for the fiscal year July 1, 1976 to June 30, 1977; to

determine the incidence of atopy among the parents and family of the closed cases; and to demonstrate the level to which employers are aware of the existence of atopy at the time of hiring employees in those plants in which a closed case of Workmen's Compensation involving skin disease occurred.

Regarding the delivery of effective dermatologic intervention at the time of the active case of occupational dermatitis, the objectives are as follows: to identify contributing factors such as nature of inplant irritants or allergens, degree of personal protection used, and work practice routine involved by those employees who represented closed cases of Workmen's Compensation attributed to skin disease; to determine the interval between development of the occupational skin disease and referral to trained personnel; to determine the level of medical and/or credibility between information gleaned from the employees representing the closed cases themselves and the employers of the closed cases; and to determine the ultimate disposition of the closed cases with respect to continuance, transferral, or termination at the place of employment.

HUMAN METABOLISM OF HALOTHANE - MECHANISMS OF TOXICITY

J.R. Trudell, Stanford University, School of Medicine, Dept. of Anesthesia, *300 Pasteur Dr., Stanford, California* 94305 (R01 OH 00978-01)

There is growing concern about chronic exposure of operating room personnel and acute exposure of patients to inhalation anesthetics. Recent epidemiological and long-term rat testing data have implicated the inhalation anesthetics in a variety of toxic reactions including liver necrosis, cancer, teratogenicity, and bone marrow defects. Many anesthetics have structural similarities to known toxic compounds such as vinyl chloride and 1, 2-dichloro-2-bromopropane. We have chosen to study halothane as a representative of the halogenated hydrocarbon inhalation anesthetics because of our previous experience with its urinary, volatile, and cellular-bound metabolites. In our previous studies we have demonstrated that human metabolism of halothane is different from that in rats and monkeys. Therefore, we propose to study metabolism in humans directly.

We have developed the methodology to purify human cytochromes P-450 to homegeneity and to reconstitute these cytochromes P-450 along with human cytochrome P-450 NADPH-reductase into a phospholipid vesicle system that is capable of carrying out metabolism like that in liver chromosomes. Because of the well-defined nature of this system, we will be able to define exact pathways of anesthetic metabolism as well as to differentiate the pathways dictated by the various cytochromes P-450 produced by several enzyme-inducing agents. We will use this human liver preparation to study production of volatile metabolites as well as binding of highly reactive intermediates to proteins and phospholipids of the liver cell. Studies in rats have associated production of toxic metabolites and liver necrosis with pretreatment by certain enzyme-inducing drugs followed by metabolism of anesthetics under anaerobic conditions. We will attempt to correlate toxicity in animals and humans with specific metabolic pathways occurring in the liver. A goal will be to define those conditions to which patients and operating room personnel should not be subjected in order to prevent significant toxic metabolism.

EPIDEMIOLOGIC METHODS - U.S. URANIUM MINERS

A.S. Whittemore, Stanford University, School of Medicine, Dept. of Family Community & Preventive Medicine, *300 Pasteur Dr., Stanford, California* 94305 (R01 OH 00991-01)

The proposed study would use probabilistic models of cellular carcinogenesis, combined with maximum likelihood statistical procedures for estimation of model parameters, to analyze lung cancer mortality among U.S. uranium miners. The parameters used in the models aad estimated from the data would have biological interpretations. They would be used to examine the following issues: 1) the dose-response relationship for exposure to radon daughters, particularly as it applies to low level exposures; 2) the nature and extent of interaction between radiation and smoking exposures in respiratory carcinogenesis; 3) the presence or absence of dose rate effect; 4) the effect of age at start of irradiation upon subsequent lung cancer risk; 5) the evolution of risk after termination of exposure.

Particular attention will be paid to implications for risk due to occupational radiation exposures at the current standards.

VIBRATION AND INDUSTRIALLY RELATED LOW BACK DISEASE

J.W. Frymoyer, University of Vermont & State Agricultural College, School of Medicine, Dept. of Orthopedic Surgery, *85 S. Prospect St., Burlington, Vermont* 05401 (R01 OH 00745-03)

Epidemiologic and mechanical studies suggest that cyclic loading (i.e. vibration) is an important etiologic risk factor in the development of degenerative disc disease. Posture, spinal stiffness, asymmetric spinal loading, and abdominal tone appear to influence the effects of vibration. Disability is more common in patients with certain personality traits. By analysis of a general practice population and questionnaire survey, we are defining the role of cyclic loading in the broader perspective of low back pain (LBP). Subgroups with and without back pain, with and without significant vibrational loadings are being identified. These subgroups are to be investigated by questionnaire and by standardized physical examination for spinal stiffness, posture, straight leg raising, and neurologic abnormality. Psychologic factors will be evaluated by computerized modified Minnesota Multiphasic Personality Inventory (MMPI) and pain drawing. Objective radiographic analysis will correlate low back pain with postural, congenital, disc space height and facet characteristics. By case studies, the environmental vibrational stresses, lifting requirements, and asymmetric loading configurations imposed on the spine will be analyzed. The role of vibration will be further studied in the laboratory using a vibration simulator. Exposure particular at risk populations will be studied using a vibration exposure meter. Safety recommendations will be given for vibrational loadings.

HYPERSENSITIVITY LUNG DISEASE IN ANIMAL WORKERS

G.L. Baum, Tel Aviv University, *155 Herzl St., Tel Aviv, Israel* (R01 OH 00763-02)

Veterinarians and animal house workers are being studied for the presence of allergic alveolitis, asthma and other manifestations of hypersensitivity lung disease caused by the animal antigens to which they are exposed. A control population of non-exposed, normal individuals is being studied as well. The test population is being assayed by questionnaire, physical examination and simple pulmonary function tests as well as immediate-type skin tests using the relevant antigens as part of a general screen. Serum obtained will be assayed by RAST for specific IgE antibodies and by precipitin tests for specific IgG and IgM antibodies. Those subjects demonstrating evidence of specific hypersensitivity by history or examination or allergy assay will have bronchial challenge done along with complete pulmonary function tests. All tests will be done on the control subjects except for the bronchial challenge. Follow-up studies will be done on a sample of the negative and positive subjects at two years after initial encounter. Prevalence of this problems will be established and development of hypersensitivity over the two year observation period will be characterized. From this risk will be calculated and modifying factors looked for.

RESPIRATORY HAZARDS OF SWINE CONFINEMENT WORKERS

K.J. Donham, University of Iowa, School of Medicine, Dept. of Preventive Medicine & Environmental Health, *Jessup Hall, Iowa City, Iowa* 52240 (R01 OH 00825-02)

A recent trend in livestock production is the use of confinement systems for increased economical production of animal protein. We have recognized potential health hazards for agricultural workers who work in these buildings. The objective of this project is to evaluate respiratory hazards present for these workers so that appropriate control measures may be taken.

Epidemiological studies have been undertaken to characterize the exposed population and quantitate the extent of the potential problem. Data collected to date suggests that there are four syndromes that workers may experience: 1) chronic irritation of the upper respiratory tract; 2) immediate hypersensitivity; 3) delayed hypersensitivity; 4) acute severe, disabling respiratory symptoms. Future epidemiological and clinical studies are designed to clarify and quantitate these early results.

More specifically, the clinical studies are to characterize the health effects of the confinement atmosphere on exposed individuals, elucidate the pathophysiology of the symptoms observed, and predict the potential for chronic lung damage. The four syndroms that have been defined by the epidemiological work will be investigated individually, primarily through challenge studies.

Environmental investigations will characterize the gaseous and particulate burden on the respiratory tract as well as variables affecting gas release from manure storage pits. Management practices and their relation to ambient levels of gases and dust in the work environment will be studied. Also, laboratory models of manure pits will be used to study measures to control gas release.

Animal studies are being initiated to predict the chronic pathological effect of the swine confinement atmosphere on the human respiratory tract.

OCCUPATIONAL HAZARDS OF ACRYLAMIDE AND HEXANE

P.S. Spencer, Yeshiva University, Bronx Campus, Albert Einstein School of Medicine, Dept. of Neurology, *1300 Morris Park Ave., Bronx, New York* 10461 (R01 OH 00851-01)

This combined clinical and experimental animal study will focus on acrylamide and hydrocarbon solvents, commercially important compounds which are significant occupational hazards because of their proven ability to produce occupational neuropathy, a type of neurological disease. The experimental part of this study will examine the known neurotoxicity and possible neuroteratogenicity of acrylamide and of 2,5-hexandione, the neurotoxic metabolite of the hydrocarbon solvents n-hexane and methyl n-butyl ketone. Light and electron microscopic examination of the nervous system of acute and chronically intoxicated animals (cats and rats) during fetal, post-natal, adult life, and in old age will allow us to determine the extent and pattern of nervous system damage and recovery with respect to age and development status. Based on our existing experimental data regarding sensory and motor dysfunction in acrylamide and hexacarbon neuropathies respectively, the clinical studies will utilize conventional and novel techniques to evaluate their usefulness and practicability in determining onset and recovery from occupational neuropathy. These studies are designed 1) to fulfill some of the Research Needs specified in National Institutes for Occupational Safety and Health Criteria Documents for Acrylamide (1976) and Alkanes (1977) and 2) to develop new, sensitive methods to prevent and detect occupational neuropathy in man.

PHYSIOLOGICAL RESPONSE TO INTERMITTENT HEAT EXPOSURES

S.A. Konz, Kansas State University, School of Engineering, Dept. of Industrial Engineering, *Anderson Hall, Manhattan, Kansas* 66502 (R01 OH 00874-02)

When working in heat, most workers wear clothing (e.g., long-sleeved shirt and trousers. However, most heat stress research has used semi-nude subjects. Workers also tend to go in and out of heat all day (intermittent exposure) while most research has continuous heat exposure for 1 or 2 hours. Most workers are heat acclimatized; much research uses non-acclimatized subjects. Our project has five phases: clothing worn in the field, insulation values, physiological responses, model validation and intermittent heat stress guidelines. In Phase 1, we will determine, for at least 25 organizations, what articles are actually worn in heat stress and recovery. In Phase 2, we will determine, using our electrically heated copper mannequin, insulation values (clo) of typical ensembles from Phase 1. In Phase 3, we will measure physiological responses of 12 acclimatized subjects at 4 temperature levels, 3 work-rest cycles, and 3 clothing levels and 2 recovery levels. Each session will last 10.5 hours (pretest, heat, post-test sessions with time for subjects to have coffee and lunch breaks in controlled environments). Heart rate, skin temperature, rectal temperature and clothing surface temperatures will be recorded automatically on tape every five minutes. Weight loss will be recorded every 60 min. In Phase 4, from our previous data and from Phase 3, we will validate our biophysical 25 node human thermoregulatory model for clothed exercising individuals exposed to intermittent heat stress. In Phase 5, from the experimental data and computer simulations using the model, guidelines will be developed giving permitted exposure to intermittent heat stress for clothed workers.

MERCURY BURDEN, HEALTH IMPAIRMENT IN DENTAL AUXILIARIES

I. Shapiro, University of Pennsylvania, School of Dental Medicine, Dept. of Biochemistry, *4001 Spruce St., Philadelphia, Pennsylvania* 19104 (R01 OH 00886-02)

Previous studies of dental personnel have indicated that mercury exposure in the dental office represents a health hazard of dental practice. Attempts to measure the clinical health deficits associated with exposure have been few. Furthermore, the investigations that have been performed have been limited to evaluating current mercury exposure through blood, urine or hair analysis. The important relationship between cumulative mercury exposure and chronic health impairment has not been studied. This research proposal addresses itself to examining this relationship.

The population consists of 300 dental auxiliaries who have had contact with mercury and a cohort of 50 dental auxiliaries who do not use mercury in their practice. Cumulative mercury levels will be ascertained by measuring bone and brain mercury levels in situ by an X-ray fluorescence technique that was developed in our laboratories. The top ten per cent of the ranked population will then be further examined for neurological and renal deficits. Electrodiagnostic studies will measure nerve conduction velocity, denervation, neuromuscular transmission and sensory actions potentials. Renal examination will include kidney urinary concentrating function, osmolality and urinary microprotein. The kidney mercury level will also be ascertained by X-ray fluorescence in the group demonstrating elevated bone mercury. Neuropsychological evaluation is being performed on the ranked upper and lower twenty-five percent of the population. A battery of eleven tests are being used. Current mercury exposure levels of these populations will also be determined through analysis of blood, urine and hair and correlated with total body mercury burden as determined by X-ray fluorescence. The results of these evaluations will indicate whether functional health deficits have occurred as a result of mercury accumulation.

JOB CONDITIONS, OCCUPATION, AND CORONARY HEART DISEASE

R.A. Karasek, Columbia University, School of Engineering & Applied Science, Dept. of Industrial Engineering & Operations Research, *Broadway & W. 116th St., New York, New York* 10027 (R01 OH 00906-02)

The object of this research is to examine U.S. data on cardiovascular disease and job conditions for associations similar to those recently obtained by these researchers in cross-sectional and prospective analysis of Swedish national data. Those findings confirmed the relationship between C.V.D. and psychosocial job characteristics using a previously untested model of job psychological strain development based on job decision latitude (low) and psychological job demands. The strength of the relationships are similar in magnitude to that found for serum cholesterol, blood pressure, smoking, and type-A behavior in the Framingham and Western Collaborative Group C.H.D. studies. These same job characteristics have been shown to be predictors of psychological strain symptoms in comparable U.S. and Swedish national surveys.

We propose to examine five major U.S. data bases including information on job characteristics and C.V.D. or C.H.D.: the H.I.S. (1972), H.E.S. (1960-62); H.A.N.E.S. (1970-75), the Western Collaborative Study, and the Framingham Study. While data measuring job characteristics is generally weak in all existing large scale U.S. C.V.D.-C.H.D. data bases, the above surveys do contain either limited direct measures of the relevant job characteristics or detailed U.S. Census Occupational Codes (382 categories). These codes can be used to indirectly assess job condition impacts with the help of job characteristic-occupation data in three national U.S. working condition surveys (1969, 1972, 1977). The U.S. data bases also allow control for conventional risk factors (especially age, smoking, serum cholesterol, type A behavior and socio-economic status). It should be noted that our model, based on work environment conditions, represents an alternative psycho-social mechanism of disease development to that implied by current 'Type A' behavior research (based on personality characteristics). Also, previous U.S. and Swedish findings based on the model have not substantially weakened when socio-economic status is controlled.

EPIDEMIOLOGICAL STUDY OF MALIGNANT MELANOMA

B.S. Pasternack, New York University, School of Medicine, Dept. of Environmental Medicine, *100 Washington Sq. E., New York, New York* 10003 (R01 OH 00915-03)

A number of factors have been previously reported to be associated with high risk of malignant melanoma. These include age, sex, race, ethnic origin, complexion, ability to tan, hair color, eye color, and sun exposure. A case-control study has been designed to determine the degree of association between the occurrence of malignant melanoma and possible risk factors, including some which have not received quantitative analysis previously. The total data base will consist of approximately 1100 cases and a similar number of controls. Cases are being drawn from the tumor registry of the NYU Skin and Cancer Unit, whereas controls are randomly selected from the NYU Skin and Cancer Unit patients without melanoma or other neoplastic conditions. It is hoped that this study will lead to the identification of high risk groups at whom future monitoring for malignant melanoma could be directed. Significant positive associations found in the study, if corroborated by others, may also identify behavior patterns, which, if modified, could result in a decreased incidence of the disease.

COHORT MORTALITY STUDY OF DIMETHYLNITROSAMINE WORKERS

W.J. Nicholson, City University of New York, Mount Sinai School of Medicine, School of Medicine, Dept. of Community Medicine, *1 Gustave L. Levy Pl., New York, New York* 10029 (R01 OH 00690-04)

This proposed research will establish a cohort of workers exposed occupationally in the past to dimethylnitrosamine. Prospective observation of their full mortality experience, from the time of first exposure, will be conducted. Expected and observed rates of death by cause will be tabulated to ascertain if unusual mortality patterns exist. Such data will have importance in assessing the potential human carcinogenicity of dimethylnitrosamine and in assessing the potential risk of environmental exposure of N-nitroso compounds.

SHIPYARD ASBESTOS DISEASE - MORTALITY EXPERIENCE

I.J. Selikoff, City University of New York, Mount Sinai School of Medicine, School of Medicine, Dept. of Community Medicine, *1 Gustave L. Levy Pl., New York, New York* 10029 (R01 OH 00682-03)

We are investigating the mortality experience of shipyard workers at a major coast shipyard, to ascertain whether their asbestos exposure will be associated with increased cancer mortality. A previous field survey of 1,000 current employees in the yard (Groton, Connecticut) showed a very high incidence of asbestosis in chest films, establishing that asbestos exposure had been common in the past.

One thousand nine hundred and sixty men were employed in the yard on January 1, 1967, for at least ten years. By December 31, 1979, 340 were known to be deceased (17%) and 1,500 (76%) were known to be alive. Of these 830 (42%) were still employed in the shipyard. One hundred and twenty remained to be traced (6%). We expect to trace well over 95% of the cohort and will then analyze the mortality experience of the group, comparing expected deaths, based upon National Center for Health Statistics data for Connecticut and for the U.S. as a whole, with the differential experience of the various trades in the cohort (pipe fitters, boilermakers, painters, carpenters, guards, foundry workers, electricians, machinists, etc.). We are also exploring the mortality experience of two additional cohorts in the same way; a ship repair yard in Baltimore, Maryland, and a new surface ship construction yard in Quincy, Massachusetts (the Connecticut yard constructs and repairs submarines). In each of the latter two, more than 2,000 workers comprise the cohorts.

It will be of interest to compare the mortality experience with that of other asbestos-exposed workers (insulators, factory workers, miners and millers), with special reference to total mortality, lung cancer, pleural mesothelioma, peritoneal mesothelioma, gastrointestinal cancer, oropharyngeal and laryngeal cancer, renal cancer and asbestosis. The statistical analysis will utilize both the death certificate enumeration and that following ascertainment, in comparing expected deaths with those observed.

AN INVESTIGATION OF OCCUPATIONAL WRIST INJURIES IN WOMEN

D.B. Chaffin, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Industrial & Operations Engineering, *Ann Arbor, Michigan* 48104 (R01 OH 00679-04S1)

Past experience has shown that there is a high incidence of chronic wrist injuries among workers who perform manual work in industry; this incidence is particularly high among female workers. For example, in recent five year retrospective study of a sewing plant that was studied in the current investigation, Wherle (1976) reported that 10.3 cases of carpal tunnel syndrome occurred per million man hours worked.

The proposed research is a continuation of a current investigation, the tentative results of which show that carpal tunnel syndrome causation has both worker and job attributes. Based upon the findings of the current study, recommendations to alleviate carpal

tunnel syndrome at the work place will be proposed. The objective of this continued research is to validate the effectiveness of these recommendations, both theoretically and empirically.

A field study that will involve implementation of the recommendations so as to intervene in the pathogenesis of carpal tunnel syndrome at the workplace is planned.

To measure the effectiveness of the recommendations, it has been necessary to develop a test battery to evaluate functional hand performance and to establish test score distributions for symptomatic populations during the past year.

An anatomical study in which the types of intrawrist forces that create morphological tissue changes within the carpal tunnel is underway to evaluate the theoretical basis of the field recommendations. Papers have been submitted to the following journals: Journal of Biomechanics, Journal of Occupational Medicine, Archives of Physical Medicine.

3.0402,

PULMONARY EFFECTS OF VINYL CHLORIDE

Y. Suzuki, City University of New York, Mount Sinai School of Medicine, Dept. of Community Medicine, *1 Gustave Levy Pl., New York, New York* 10029 (R01 OH 00681-03)

Completion of animal studies on pulmonary effects of vinyl chloride at heavy doses (600 and 300 ppm) with short exposure (a month) will be attempted. Both oncogenetic and non-neoplastic pulmonary effects at the late stage (40 weeks) after the exposure will be investigated. Some animals of 600 ppm will be kept for more than one year to study delayed-responses of the lung tissues to the chemical.

A comprehensive evaluation of pulmonary effects of vinyl chloride will be made from the data analysis of three animal studies, (1) heavy doses and long-term exposure, (2) small doses and short-term exposure and (3) heavy doses and short-term exposure.

Histopathological studies of human lung sections obtained from deceased workers at vinyl chloride polymerization plants will be continued.

LONG-TERM MORTALITY STUDY OF WORKERS IN THE FURNITURE MANUFACTURING INDUSTRY

A. Blair, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (70)

Epidemiologic studies have shown that persons employed in occupations with exposure to fine-wood dusts experience high mortality from cancer of the nasal sinuses and possible Hodgkins's disease. These findings, along with exposure to potentially hazardous chemicals such as methyl alcohol, toluene, xylene, formaldehyde, paints, varnishes, and lacquers, indicate the need for a fuller evaluation of the mortality experience of furniture workers. The National Cancer Institute with cooperation from the United Furniture Workers of America is initiating cohort mortality study of union members employed in the furniture industry 20-30 years ago. Records from the Insurance Fund of the union are currently being abstracted to establish the cohort. The number of study subjects is expected to be 20,000 to 25,000. The mortality experience of these workers will be compared to that of the general U.S. population after appropriate adjustments for differences in age, race, and sex. Exposure categories will be developed using job titles and furniture type. In addition, union locals and companies will be contacted in an attempt to obtain further information about working conditions and exposures.

MORTALITY AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO TOLUENE

F.B. Stern, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (NIOSH NO. 8604)

This project involves a retrospective cohort mortality analysis of an occupational population exposed to toluene to determine whether or not there are any long-term health effects. The first phase of the investigation is a feasibility study to determine extent of exposure, to characterize the work environment, and to assess the feasibility of conducting the mortality portion of the study. The next phase of the study will be to conduct a retrospective cohort mortality study and analyze the results for any excesses in cause-specific mortality. The final phase will be to examine the mortality patterns by specific departments to see to what extent the toluene exposure may have contributed to any excess mortality experience of the cohort.

Vital status follow-up from the U.S. Shoe Company cohort in Harrison, Ohio is approximately seventy-five percent completed. Over 2400 persons are known to be alive and 400 deceased out of a population size of about 4000 persons. For the U.S. Shoe Company in Greenfield, Ohio, progress has been much slower due to data entry problems. This has delayed vital status follow-up substantially. As of March 1981, 50% of the follow-up effort was completed. Both cohorts are predominantly female.

A preliminary industrial hygiene report has been written by SRI International on 'Occupation Exposures to Toluene in the Shoe Manufacturing Industry'.

MORTALITY STUDY OF WORKERS EXPOSED TO SMALL FIBROUS GLASS

D.L. Bayliss, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (033006 TICNO)

In order to evaluate if there is excess mortality of malignant respiratory disease in workers exposed to fibrous glass ranging in size 1 to 3 mu in diameter, NIOSH has initiated a retrospective cohort mortality study of workers exposed to such fibers in a flame attenuation process that existed in the 1940s. This study supplements an earlier retrospective cohort mortality study on the same plant that showed increased mortality of non-malignant respiratory disease. The population of the previous study was generally exposed to fibers greater in diameter (e.g., ● 3 mu) than have been shown to be carcinogenic in man or animals and therefore the present study was deemed warranted to evaluate the small fiber diameter exposures. To date, records of 2,000 employees have been obtained and vital status ascertainment completed. In order to determine whether the worker group exposed to the small diameter fibrous glass particles suffer from unusual cancer mortality, matched control group has been selected from the non-exposed segment of the worker population at the above plant. A final report is being completed.

A STATE-BASED PILOT EFFORT FOR OCCUPATION-RELATED DISEASE SURVEILLANCE

J. Sestito, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-G11-627)

The need for an effective occupational illness surveillance program has been long recognized. Past and current efforts have been undertaken at various levels of public and private involvement. It is sufficient to note the efforts of BLS, AMA's Registry of Effects to Toxic Chemical Exposures, and efforts utilizing Workmen's Compensation data (California, Wisconsin, Washington). The purpose of this project is to develop, on a pilot basis, a program of occupation-related disease surveillance at the State Agency level.

Pilot activities will be developed through a proposed agreement with a State Department of Health. First-year activities will be directed to the establishment of information sources (corporate medical physicians, private physicians, unions, small business establishments) and a protocol for the collection, verification, analysis, and dissemination of reported occupation-related disease. Second-year activities will be directed to the implementation of the first-year's protocol.

An Evaluation of the cost and effectiveness of the Pilot Effort will be conducted at the completion of the second-year's activities.

FY 79 ACCOMPLISHMENTS: Established relationships with Ohio's Industrial Commission to refer cases to the Beryllium Case Registry. Developed a draft cooperative agreement to develop occupational health surveillance systems.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $91,000

LEAD SURVEILLANCE FEASIBILITY ASSESSMENT

J. Salg, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-G11-670)

Biological monitoring of workers exposed to lead is prescribed in the OSHA Final Standard on Lead (29 CFR, Part 1919.1025). In excess of one million tons of lead are processed yearly in the U.S. Potential occupational exposure to lead and its compounds has been observed in at least 120 occupations within a variety of industrial settings (lead smelting, lead pigments manufacturing, shipbuilding and ship repairing, auto manufacturing, and others). A medical surveillance program could potentially have a strong impact on containing lead absorption within defined limits presumed to be non-toxic. The feasibility of establishing a comprehensive medical surveillance system for the monitoring of occupational lead exposure has broad implications. Activities proposed during FY 80 will be undertaken to assess costs, methodologic alternatives, and benefits or consequences of monitoring activities.

WORKSHOP ON MACHINE-PACING STRESS PROBLEMS

M. Smith, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOB-B12-769)

Machine-paced work is being viewed as a potentially significant contributor to worker stress and ill health. The National Institute for Occupational Safety and Health has a major effort underway at defining the impact of machine-pacing on worker health. In addition, there are various governmental and university research groups throughout the world conducting related research. One such group is the Institute of Occupational Health in Finland. The purpose of this project is to conduct a workshop, co-sponsored by NIOSH and IOH Finland, to sort out and review the latest findings, and exchange ideas for future work on the subject. A select group of international experts will be invited to make formal presentations concerning their research and participate in discussion groups at this meeting which will be held either in Helsinki, Finland or Washington, D.C.

NATIONAL OCCUPATIONAL HAZARD SURVEY - #2

D. Sundin, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-C11-639)

The foundation of experience in sampling statistics, data editing and analysis, resolution of trade-name product ingredients, and managing a field survey team which was developed during the original National Occupational Hazard Survey will be used to support and guide the planning and implementation of a second national Survey. The NOHS survey forms, data processing systems, programs, and procedures, will be critically examined to identify areas where improvements can be made.

The sample of facilities to be surveyed will cover a wide range of industry types, facility sizes, and geographical locations, and be constructed in such a way as to permit the development of national exposure estimates. A team of industrial hygienists will be recruited and trained intensively in observational survey techniques. This team will be deployed in the sample of facilities for the purpose of gathering plant level data on the nature and extent of potential occupational exposures to chemical and physical agents, including trade name products. The surveyors will also collect information on the duration of these exposures, the physical form of the substances, and the intended control devices or procedures. Plant management will be interviewed to assess the incidence of illness which may be attributable to occupational factors, and the measures which have been implemented to insure the health and safety of the workforce.

Manufacturers of products identified as potential exposure agents will be contacted and asked to supply ingredient information on their products, which will be added to the main data base.

SAFETY AND HEALTH OF COMMERCIAL DIVERS

A. Purdy, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOK-G22-296)

Under the provisions of the Outer Continental Shelf Act, NIOSH has the responsibility for providing for the safety and health of commercial divers who explore for ore and mineral resources in the waters of the Outer Continental Shelf (estimated at 200-1200 divers). To identify health and safety problems of divers, NIOSH will collect accident, illness and mortality information from Federal agencies (NOAA, USCG, OSHA), the private sector (Brotherhood of Carpenters and Joiners) and foreign diving information sources. An Interagency Agreement with NOAA will establish a National Diving Accident Network to obtain medical information from hyperbaric treatment centers. A Hyperbaric Workers Safety and Health Data Center will be established at NIOSH to process this information.

A second objective of this project will be to provide support for studies on previously identified health problems of divers and caisson workers. Contracts will provide research on emergency diver evacuation procedures, to determine the most effective strategy to provide heating for Arctic divers, and to develop a set of interim decompression schedules for caisson workers. Also, a series of conferences will be held to (1) develop methods for delayed decompression sickness treatment, (2) determine methods for investigating sudden loss of consciousness in divers, and (3) determine alternate strategies for diving deeper than 1,000 feet.

Previous accomplishments in the area of occupational disorders associated with hyperbaric environments include publication of the proceedings of a symposium on Dysbarism Related Osteronecrosis, the development of a National Research Plan for Divers, and participation with NOAA, the USCG, OSHA and the diving industry in the development of a proposed research plan which would meet the needs of the Outer Continental Shelf Act of 1978.

MORTALITY AND INDUSTRIAL HYGIENE STUDY OF A URANIUM ENRICHMENT FACILITY

D.P. Brown, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-BAB-546)

In recent years there has been increased concern over the possible adverse health effects from occupational exposure to radiation. However, there are few epidemiologic studies that have examined the mortality patterns among workers with documented long-term, low-level exposure to alpha radiation.

The Goodyear Atomic Coperation (GAT), which is a Department of Energy (DOE) facility, offers a good worker population for such a study. This facility enriches uranium from 0.7 percent U-235 to 98 percent U-235. The primary exposure of interest is internal alpha radiation from inhalation or ingestion of UF6. Based on existing data from industrial hygiene samples and biological monitoring, the workforce will be divided into gradients of alpha exposure by job classification. Additional industrial hygiene surveys will be conducted to characterize other exposures at the plant and correlate them to job classifications.

A retrospective cohort mortality study will be conducted to determine whether or not the study population has experienced any increased in cause-expecific mortality compared to the mortality of a standard population. This analysis will be done by subgroups according to exposure.

INJURY EPIDEMIOLOGY

P. Coleman, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Safety Research, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VLB-S11-807)

This project incorporates, under one heading, the three major components of the Safety Surveillance Branch's current program. These components are: 1. Safety Intelligence - this project continues from last year the efforts to establish an adequate surveillance system for safety research based on existing data, and to initiate change in this area to improve and implement future surveillance data bases. 2. Epidemiology of Injury - this project is a major initiative to restructure concepts, principles, and problem-solving approaches to injury prevention and safety research through a cooperative agreement with three academic institutions. While the general principles for adapting disease epidemiology to injury problems will be the first objective, each grantee will be asked to focus on one of the following areas: falls from elevation, overexertions, or caught-in-machine types of injuries. 3. Worker-Identified Hazard Control System - this project will serve as one demonstration of systems principles applied to safety and in-plant communication to improve worker input to the hazard management process.

EPIDEMIOLOGICAL MORTALITY STUDY OF TENNESSEE VALLEY AUTHORITY EMPLOYEES

T.D. Waters, U.S. Tennessee Valley Authority, Office of Management Services, Div. Of Health & Safety, Div. of Medical Services, *139 Patten Towers, Chattanooga, Tennessee* 37401 (VKP-G21-189)

This mortality and industrial hygiene study of workers in the Tennessee Valley Authority's coal-fired power plants is being conducted in two parts. The second part can be found on TOX-TIPS 52-5.

The primary purpose of this study is to compare the mortality incidence of employees in coal-fueled steam-electric power plants to control groups in other lines of work. A secondary purpose is to determine the mortality incidence of a large heterogeneous work force in an established energy-producing industry.

The cohort selected for this study was 23,000 male annual employees with two or more years continuous service with TVA between 1955 and 1975. The project is expected to be completed in September 1981.

ANALYSIS OF X-RAY SURVEILLANCE DATA

L. Boyce, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKQ-M11-254)

This project provides for obtaining coal mine dust sampling data for MSHA, merging this data with our X-ray examination data collected in periodic x-ray exam program and building a data base which will be analyzed in FY 81, to determine the prevalence and progression of coalworkers' pneumoconiosis among U.S. underground coal miners. During FY 81 the correlation between radiological progression of CWP and gravimetric coal mine dust measurements will be determined.

CUTANEOUS TOXICITY HAZARDS

R. Niemeier, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOO-G24-779)

The most common of all occupational illnesses are diseases of the skin which, according to the Bureau of Labor Statistics (1976), accounts for 40% (1.5 cases/1000 workers) of all reported occupational diseases exclusive of injuries. Inadequacy of the reporting system led the OSHA Advisory Committee on Cutaneous Hazards to conclude (12/19/78) that the incidence was actually 10 to 50 times greater than reported by BLS. Clinical eczematous dermatitis, caused by primary irritants, allergic sensitizers, and photo-sensitizers, comprises 75 to 80% of occupational dermatoses.

The objectives of this project are: 1) To actively continue the skin and eye irritation and skin sensitization testing program for NIOSH priority chemicals. Chemicals planned for testing include: acrolein (85 million pounds produced annually, 7,500 workers exposed); ethyl silicate (460,000 workers exposed); cyclohexylamine (6.5 million pounds produced annually, 6,000 workers exposed); and N,N-dimethylacetamide (65 million pounds produced annually, 8,500 workers exposed). 2) To analyze field samples submitted by DSHEFS health hazard evaluation effort using skin and eye irritation and/or skin sensitization methods. 3) To develop, evaluate, and standardize photosensitization methods and scoring procedures in a corroborative in-house effort with the Physical Agents Effects Branch, DBBS. Industrial photosensitization responses are encountered in a number of industries including manufacture and formulation of drugs, cosmetics, dyes, flourescent brighteners, photocuring, photoengraving, beauticians, printers, agricultural workers, etc. 4) To formulate a long-term program in cutaneous toxicity assessment which may include: a) development and evaluation of a commercially marketable kit for the identification of dermatogens; b) development of a model for percutaneous absorption

kinetics including aging effects and testing the model's application to evaluate protective clothing; c) further investigations on the role of biologicals in occupational dermatoses.

INDUSTRIAL HYGIENE STUDIES OF TENNESSEE VALLEY AUTHORITY WORKERS IN COAL-FIRED POWER PLANTS

J.J. McFeters, U.S. Tennessee Valley Authority, Office of Management Services, Div. Of Health & Safety, Div. of Occupational Health & Safety, Safety & Industrial Hygiene Branch, *Muscle Shoals, Alabama* 35660

The NIOSH/TVA subagreement 1, 'Industrial Hygiene Studies of TVA Workers in Coal-Fired Power Plants,' is part of a larger cooperative research agreement to investigate the occupational health and safety impacts of electric power generation. (See also TOX-TIPS 52-3.) This investigation concentrates on measuring the exposure to those hazardous agents commonly found in coal-fired power plants: SO_2, NOx, respirable coal dust, respirable fly ash, and asbestos. Major craft groups in TVA's coal-fired power plants are being sampled using the personal sampling methods recommended by NIOSH for determination of average annual personal exposure levels by craft to the five agents. In addition to the sampling, historical data on coal-fired power plant exposure were gathered from TVA files for the past 25 years when they were available.

3.0418,

IMMUNOLOGY OF GRAIN AND OTHER ORGANIC DUSTS

S. Olenchock, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKC-R23-109)

This project encompasses an immunological study of organic dusts, with emphasis on grain dust. The study is designed to continue and expand in stepwise progression NIOSH in-house research related to the activation of complement by airborne grain dusts. In vitro studies have demonstrated that grain dust extracts generate complement-dependent chemotactic factors (for human PMN) after incubations in normal human serum. It is the intent of this study to analyze in vivo effects of dust/extract on animal lungs. In addition, attempts will be made to characterize the 'active' factions in the grain.

Collaboration with EIB, USDA, and WVU will continue in this project by examining sera from swine confinement house workers and matched controls for precipitating antibodies to various serologically distinct leptospirae and brucellae. Dusts from various animal confinement houses will be used to explore the potential for occupational exposure to gram negative bacterial endotoxins.

This project is also designed to expand a study of precipitating antibodies in sera from workers in the textile industry, and cotton in collaboration with CIB analyze sera from workers exposed to known amounts of dust from model cotton cardrooms as well as examine the various cotton samples and respirable filters. Knowledge gained in our previous study of grain and complement will be utilized to evaluate the effects of wood dust extracts on the complement cascade in collaboration with EPIB.

Finally, exposure to fungi is documented in many working groups. We intend to pursue an animal study of the long term effects of exposure to one of the most ubiquitous fungi, Aspergillus. Our previous NIOSH project has formed the basis of this study. Worker Groups Affected: Grain handlers (at all phases), animal confinement house workers, wood workers/millers, cotton textile workers. Benefits to Workers: Understanding of one mechanism of acute inflammation which could lead to chronic disease. Identification of potentially harmful components in dusts.

3.0419,

TECHNIQUES FOR IDENTIFYING HIGH-RISK OCCUPATIONAL GROUPS

J. Seta, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-G11-645)

Several projects in the Surveillance Branch have identified sources and methods for acquiring intelligence on occupational hazards through programs of interaction with individuals or groups with an interest in workplace hazards. For example, a cooperative effort with OCAW and ICWU has produced a system which permits the unions to organize and access potential exposure information acquired through the local organizations. The system permits the unions' health and safety staff to identify potentially exposed workers by plant site as new information on a hazards is received.

Another project developed and pilot tested forms and manuals which make it easy for an employer to catalog potential exposure agents within his own plant and systematically identify high risk occupational groups. These materials form an important adjunct method for collecting data on potential exposures without requiring field surveys by NIOSH personnel, are thus economical data acquisition techniques with potential application in other NIOSH programs.

CASE-CONTROL STUDY AND OPHTHALMOLOGY SURVEY OF PLANT IN CHARLESTON, W. VA. - NCI

E. Egan, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-678)

In response to an employee request, NIOSH began an investigation into an alleged cancer hazard at a DuPont chemical plant in Belle, West Virginia. Subsequent to this employee request, NIOSH received a completed report of a DuPont epidemiologic study that demonstrated an excess risk of cancer of the eye, kidney and lung among employees at the DuPont Belle plant.

In order to thoroughly investigate the causes of this excess cancer risk identified among employees at the DuPont Belle plant, NIOSH proposed to conduct a cross-section ophthalmologic survey of workers at DuPont Belle plant and a case control study of the eye and kidney cancer cases.

The cross-section ophthalmologic survey was conducted from March 13, 1978, to April 21, 1978. A total of 1153 persons were examined. One additional case of ocular melanoma was discovered in a pensioned employee. A follow-up of persons discovered in the course of the survey to have pigmented lesions of the optic fundus is planned for FY 80.

The work histories of all the eye and kidney cancer cases identified at the DuPont Belle plant will be compared to the work histories of a group of matched controls to determine if the cancer cases worked more frequently than the controls in any specific job areas.

3.0421,

BIOLOGICAL HAZARDS IN THE WORKPLACE

L. Elliot, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-BDD-575)

Causative agents of occupational diseases may be classified as chemical hazards, physical hazards, or biological hazards. NIOSH has devoted little effort or attention towards bio-hazards in the workplace. Biohazards include acute and chronic infections, parasitism, and toxic or allergenic reactions to plant or animal agents. Occupational exposure to irritating toxic or allergenic substances produced by a spectrum of plants, animals and microorganisms is evident.

Clearly, there are known diseases that are, or could be, related to occupation; brucellosis, tularemia, tuberculosis, hepatitis, bagassosis, bark stripper's disease, and coccidioidomycosis. Infections, dermatitis, asthma, urticaria, or photosensitization may frequently be the result of occupational exposure, yet not diagnosed as an occupational disease. In the past 30 years, 164 deaths have been reported from a total of 3921 'laboratory acquired infections.' These figures do not include occupationally related deaths from biological hazards in abattoirs, the fermentation industry, grain milling, agricultural, construction, or forestry operations.

An extensive literature review will be conducted to identify the various agents, etiology, and occupations exposed. Where appropriate, walk-through surveys will provide an opportunity to evaluate control technology and work practices. Dependent upon the findings, scope of the project may be narrowed. The principal product of the project will be a technical report documenting the findings and recommendations for further investigations.

3.0422,

MORTALITY AND INDUSTRIAL HYGIENE STUDY OF FORMALDEHYDE

L. Elliot, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-BBT-576)

A study of formaldehyde was initiated because of findings reported by CIIT that low levels of formaldehyde were carcinogenic in rats. To date, an extensive literature review is being conducted and efforts to establish a suitable cohort and determination of exposure ranges are in process. Procedures of formaldehyde are exposed, but not numerous enough for a cohort. Mushroom growers (formaldehyde is used as a fungicide) have good records and may be suitable depending upon the range of exposure. This is awaiting analysis.

Formaldehyde has been used extensively in various manufacturing processes since the late 1940's. Formaldehyde resins, fertilizer, wood and paper products, and textiles have been the major industries using formaldehyde. An estimated 1.4 million workers are exposed to formaldehyde in 57,000 plant units.

This project will be composed of two portions. Initially, efforts will continue to locate a suitable population of workers for the cohort mortality study. Walk-through surveys may be required. Textiles, wood, and paper products are logical areas of investigation. Secondly, the industrial hygiene portion of this study will determine the extent of exposure across a large general worker population. The literature contains very little in this area. An in-depth industrial hygiene study will also be conducted to characterize the environment of the defined population in the epidemiological study.

3.0423,

MORTALITY ANALYSIS OF UNITED AUTO WORKERS COHORTS

J. Whalen, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-BBX-607)

Exposure to known or strongly suspected carcinogens (e.g., asbestos, chromate pigments and plating solutions, coke oven emissions, cutting fluids, etc.) has been documented for workers in the automobile industry as well as in related industries such as metal working. Recently, studies have indicated increased proportions and rates of cancer deaths among workers in these industries. Most of these studies have been of a preliminary nature, and additional epidemiology studies are required to further define any hazards which may exist in these industries.

A preliminary evaluation of the United Auto Workers International Union's (UAW) computerized central pension files, as well as membership and seniority records, indicates that this data base is adequate to

conduct epidemiology studies of disease excess and disease etiology in the union membership. Therefore, when considering the uniqueness of this data base, a contract will be awarded to UAW to conduct studies of occupational cancer epidemiology. In addition to providing epidemiology studies of the automobile and related industries, it is hoped this project will serve as a model for self-analysis by other large labor unions.

3.0424,
RESEARCH ON CAUGHT-IN TYPE INJURIES

J. Etherton, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Safety Research, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VLD-S20-804)

The NIOSH Division of Safety Research long-range plans indicate a high priority for research to reduce the incidence of injuries classified as 'caught-in, under, or between' using the ANSI Z16.2 classification scheme. This type of injury most frequently occurs in manufacturing operations where employees operate machines and equipment.

The program consists of three continuing studies and three new studies. The continuing studies are: 1. Metalcutting Lathe Safety - an epidemiologic and ergonomic investigation of lathe design and operating procedures. There are about 150,000 lathe operators in the United States. 2. Reliability of Pressure Sensing Devices - a contract to develop performance criteria for light curtains used to safeguard presses. 3. Assessment of Machine Safeguarding Alternatives - a contract to develop a quantitative risk assessment method for machine safeguarding methods and devices.

The new studies are: 1. Hand speed assessment to determine appropriate distance to locate safety devices from machine point of operation (in-house). 2. Perform a safety evaluation of the OSHA experimental variance on self-tripping light curtains for operating mechanical power presses (contract). 3. Establish adequate methods for testing the sensitivity of radio-frequency presence sensing safeguards (contract).

3.0425,
COHORT STUDY OF AUTOMOTIVE WOOD DIE AND MODEL MAKERS

C. Robinson, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-BBS-568)

A PRM study conducted by NIOSH on 1257 deceased benefit-eligible members of the National Pattern Makers' League has shown significant proportionate excesses of deaths due to colon cancer and brain tumors. When divided by local leagues into wood shops and metal shops, wood shop pattern makers were observed to have a significant excess proportion of deaths due to leukemia. Non-significant excesses of cancer deaths were found at a number of other sites. Two other studies conducted independently by Sloan-Kettering Cancer Institute and Michigan Cancer Foundation have also shown significantly increased mortality from colo-rectal cancer, as well as elevated bladder and lung cancer rates in subgroups of the study population. Taken together, these three studies suggest increased cancer association with this occupation.

To further investigate these findings, a retrospective cohort mortality study and an environmental assessment are being conducted of about 2000 automotive wood die and model makers who were ever employed at Chrysler, Ford, and General Motors in 1940-1978. The cause-specific mortality of these workers will be compared with that of the general U.S. population. Any unusual patterns of mortality will be examined carefully considering employment work history data and environmental sampling data in an effort to untangle some of the exposures in an environment which includes exposures to wood and plastic dusts, glues, epoxy resins, and solvents.

An industrial hygiene characterization of the model shops was initiated in FY 80. Workers' exposures to total and respirable wood dust, solvents, and amines were measured. These surveys will be completed in FY 81. Surveys will include GM Fisher Body plant, Ford Body Engineering, Chrysler Highland Park, and four job shops represented by the Warren Association.

3.0426,
MORTALITY AND INDUSTRIAL HYGIENE STUDY OF PHOSPHATE WORKERS - MINING

R. Herrick, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-M22-668)

NIOSH is conducting an epidemiologic study of the mortality patterns among phosphate (fertilizer) production workers. Interest in the chronic health effects associated with this industry developed because of three observed cases of lung cancer in phosphate production workers. All three men were reported to be non-smokers. The hypothesis of an association between lung cancer and phosphate exposure seems to be supported by studies by other Federal agencies and the Florida State Department of Health, all of which have suggested an increased rate of lung cancer among the county populations surrounding the phosphate plants. This study involves: 1) industrial hygiene evaluations at a number of phosphate mining and phosphate fertilizer plants, 2) a retrospective cohort study of phosphate fertilizer workers' mortality patterns, and 3) a case control study on the same population studies in the cohort study to determine if the risk of lung cancer is associated with employment in specific job categories. In FY 80 the overall industrial hygiene report will be finalized. At that time it will be determined if any additional industrial hygiene monitoring is needed. Follow-up will continue for cohort study members until the vital status of approximately 95 percent has been determined. When this is accomplished, analyses can be done for retrospective study and cases and controls can be chosen for the subsequent epidemiologic study.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $113,000

3.0427,
RESPIRATORY QUESTIONNAIRE DESIGN AND VALIDATION

D.M. Attfield, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKL-M50-257)

The respiratory symptoms questionnaire is extensively used in epidemiological research. The form presently used by the Division of Respiratory Disease Studies of NIOSH is based on the older British Medical Research Council format and is now considered outdated, inadequate, and in some ways, inappropriate.

This project will involve the drafting of a new questionnaire based on existing versions which will be suitable for modern research in occupational epidemiology of lung disease. The proposed questionnaire will be thoroughly tested and evaluated in a series of checks on validity, comparability, and reproducibility.

3.0428,
CURRENT INTELLIGENCE SYSTEM

N. Leidel, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Criteria Documentation & Standards Development, *5600 Fishers Ln., Room 3-32, Rockville, Maryland* 20852 (VID-D50-077)

The basic purpose of the Current Intelligence System is to promptly review, evaluate and supplement new information received or generated by the National Institute for Occupational Safety and Health (NIOSH) on occupational hazards which are either unrecognized or are more severe than generally known. As warranted by this evaluation the information is capsulized and disseminated to NIOSH staff, other government agencies, the occupational health community (which includes labor, industry, academia and public interest groups), and the general public. The Current Intelligence Bulletins prepared in this project describe measures designed to minimize human risks. This system also serves to advise selected members of the above groups of specific knowledge recently acquired by NIOSH which pertains to their particular occupational environments.

In FY 80 the Branch will establish, as part of the Current Intelligence System, Current Intelligence Notes (CIN) on a quarterly basis. CIN's will contain information which is insufficient for a full Current Intelligence Bulletin. The 'insufficiency' could be a lack, of epidemiological data, minor occupational impact due to low exposure estimates, etc. Several subjects will be addressed in each Current Intelligence Notes.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $273,251

3.0429,
MORTALITY STUDY OF CHEMICAL PLANTS IN THE KANAWHA VALLEY IN WEST VIRGINIA - NCI

R. Rinsky, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-680)

The Union Carbide Corporation has begun a study to examine the mortality patterns among their employees in the Kanawha Valley. They plan to determine the vital status of all of their past employees and analyze deaths observed by life table and case control studies.

They have requested that NIOSH become involved in what would be a joint venture. NIOSH would provide technical expertise, computer support, and limited follow-up, while Union Carbide would provide clerical staff for coding and would develop a history of the plants operations.

This study has particular significance in light of the NIOSH effort in the Union Carbide, Texas City study, since most of the processes conducted in Texas City are also conducted in the Kanawha Valley. Also, it will be of value in the NIOSH study of workers exposed to ethylene oxide which is of Union Carbide workers in the Kanawha Valley. There is opportunity for a number of cohort studies to be developed here.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $105,000

3.0430,
MORTALITY STUDY OF INCREASED BRAIN TUMOR INCIDENCE IN TEXAS CITY, TEXAS

S. Leffingwell, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-653)

In response to a complaint of alleged excessive brain tumors among employees at the Union Carbide Company of Texas City, Texas, the Houston South Area Office of OSHA launched an investigation in November of 1978. After a careful inquiry, OSHA requested technical assistance from NIOSH in evaluating the problem.

Preliminary data, supplied with aid of the company, local unions, and local physicians and surgeons, show ten cases in which death certificates indicated brain tumor as cause of death. One additional living employee was found to have a brain tumor. The cell types were predominantly glioma or glioblastoma multiforme with one 'meningioma, angioblastic (sarcoma)'. The workforce at the plant presently numbers 2500. Between 7.5 and 10 thousand workers have worked in the plant between 1941, when the plant began operation, and the present.

Present plans call for additional case-finding, case confirmation by pathological review of tissues, a proportional mortality study (as check of methodology which may be useful elsewhere), a case-control study of brain tumor deaths, and a cohort mortality

study. Coding of company records is being completed and the case-control study will begin soon.

CASE CONTROL STUDY OF GOODPASTURE'S SYNDROME ETIOLOGY

W. Halperin, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-622-600)

Goodpasture's Syndrome (GPS), a rare but devastating form of renal failure, is characterized by necrotizing glomerulitis and life threatening pulmonary hemorrhage. Consistent with an occupational disease, GPS is more common in males than females, and more common in younger rather than older adults. The etiology is thought to be autoimmune, although tentative associations with influenza and hydrocarbon solvents are alleged. One study documents prominent solvent exposure in six of eight cases interviewed, but no assessment of exposure in controls was attempted.

A case control study of the causes of GPS will require nationwide interviews of 75 cases and 150 controls. Methods of case ascertainments are now being explored.

3.0432,
MORTALITY, MEDICAL AND INDUSTRIAL HYGIENE STUDY OF GOLD MINERS EXPOSED TO ASBESTIFORM MINERALS - NATIONAL CANCER INSTITUTE

D.P. Brown, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Surveillance Hazard Evaluations & Field Studies Division, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C21-596)

The NIOSH recommended standard in 1972 for asbestos exposures of 2.0 fibers longer than 5 microns per cubic centimeter of air (fibers greater than 5 microns/cu.cm) was made with the recognition that health data for exposures to low fiber levels and definitive information on the biological response to different sized fibers were not available. NIOSH in 1976 recommended a standard of 0.1 fiber greater than 5 microns/cu.cm.

In 1976 NIOSH reported on a mortality study of a mining population exposed to amosite asbestos (cummingtonite-grunerite) concentrations below 2.0 fibers greater than 5 microns/cu.cm and with most fibers being shorter than 5 microns in length, that demonstrated significantly increased mortality due to both malignant and non-malignant respiratory disease.

The purpose of this project is to complete an expanded retrospective mortality study (contract), analyze the data, and prepare a final study report utilizing the results from the completed industrial hygiene and medical studies.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $73,000

3.0433,
MORTALITY, MEDICAL AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO NITROGLYCERIN

G. Reeve, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-G21-669)

About 8000 workers are exposed yearly to nitroglycerin (NG) during its manufacture. Not only is work with this agent hazardous because it is explosive, but workers also suffer from acute toxicity (headaches due to vasodilation), may have excessive numbers of sudden deaths while employed (posibly from coronary vasospasm), and may suffer from excessive cardiovascular mortality after retirement.

An opportunity exists at the Radford Arsenal in Virginia to study cohort of 37 current workers and a much larger number of former nitroglycerin workers. A cohort mortality study (Va. deaths as comparison) would be valuable to establish the fact of excess death during employment and after separation. Since the plant physician has done periodic electrocardiograms and excluded workers with abnormalities from NG exposure, a potential exists to compare the mortality of NG workers with ECG abnormalities to NG workers with normal ECGs. This comparison would not be meaningful unless another group of non-nitroglycerin workers is followed in the same way.

These same groups would be used to determine if there is a characteristic NG abnormality on the ECG and also if abnormalities are present at the same rate in non-NG workers.

If there is excess mortality in workers long after separation from exposure, it will be valuable to investigate its cause by comparing heart disease risk factors in NG retirees compared with other retirees. Risk factors such as blood pressure, lipids, etc. would be evaluated.

MORTALITY STUDY OF POTASH WORKERS

R. Waxweiler, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-M22-664)

The long term effects of diesel exposures need to be thoroughly evaluated as diesel fuel begins to take on a more important role in our country's energy policy. An occupation believed to have fairly high levels of diesel exposures is underground mining. Although most mines would have many other confounding exposures such as asbestos, radon daughters, and arsenic, potash mines have presumably non-carcinogenic environments as determined by a previously conducted retrospective cohort mortality study of 2743 underground and 1143 surface potash miners (Waxweiler et al., J. Occup. Med. 1973). Diesels were introduced in these mines in the early 1950's. By extending the epidemiologic study from 1967 to include follow-up through 1978, a 25 year latency period could be evaluated for many of the miners. In-depth industrial hygiene surveys would characterize current worker practices. The control technology section of NIOSH has an analogous project to evaluate diesel exposures underground in relation to such parameters as duty time and preventive maintenance.

SPONTANEOUS ABORTIONS AMONG EMPLOYED WOMEN

B. Albright, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-W22-665)

NIOSH periodically receives inquiries about complaints of fetal loss from women employed in various work places. Beyond the generally accepted estimate of gynecologists that about one pregnancy in ten terminates in spontaneous abortion and one well-controlled study in Hawaii with few white participants, there are no reliable standards to which we can compare the experience of a group of women. Furthermore, effects of prior abortions on the probability of successful completion of a present pregnancy are not well documented.

This study would seek to establish rates for spontaneous abortions in a variety of working populations through the following steps: 1. Concurrent literature review and consultation with experts or organizations interested in pregnancy outcome to assure that this information is not already available. 2. Feasibility study to ascertain whether large national organizations with sizable constituencies of young women would assist in this type of study. Organizations for consideration may include the National Education Association; the International Ladies Garment Workers Union; the American Federation of State, County, and Municipal Employees; and female federal employees. We would be looking for cohorts with differing socio-economic and regional backgrounds but without high exposures to toxic agents. 3. If a cohort could be found, members planning to become pregnant would be asked to register with NIOSH. Each woman would be given a log book in which to record each menstrual period and a home pregnancy detection kit. Each participant would be given a questionnaire dealing with demographic data, past pregnancy history, etc.

3.0437,
MORTALITY AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO SULFURIC ACID

J. Beaumont, Enviro Control Inc., *11300 Rockville Pike, 1 Central Plaza, Rockville, Maryland* 20852 (VMH E21-579)

This project is a historical prospective mortality study of workers exposed to sulfuric acid mist. Although the acute dangers of sulfuric acid, e.g., corneal injuries and mucous membrane irritation, are well recognized, the only chronic effect documented to date is corrosion of tooth enamel. There have been very few epidemiological studies of sulfuric acid exposed workers; however, despite the fact that about 30 million tons are produced annually in the U.S. and that about 200,000 workers have potential exposure. The public is also exposed because sulfur dioxide, a common air pollutant, partially oxidizes in the atmosphere and on respiratory tissues to sulfuric acid.

Pulp facilities, sulfuric acid plants, copper sulfate processes, fertilizer plants, titanium dioxide manufacturing, cellophane manufacturing, battery plants, and pickling operations in the steel industry have all been considered for study, and it has been concluded that pickling offers the best combination of number of workers and substantive (and relatively pure) exposure. Walk-through surveys have been conducted of four steel manufacturing plants; data collection at one or more will be conducted by the project contractor, Enviro Control, Inc. Industrial hygiene aspects will be conducted by NIOSH.

3.0438,
CASE-CONTROL STUDY OF REPRODUCTIVE OUTCOMES

J. Salg, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-W11-507)

As part of the development of nationwide capabilities to assess occupational health effects and hazards,

the Surveillance Branch has emphasized the use of existing sources of relevant comprehensive data. Information derived from the use of existing data sets should help in the identification of high risk occupational groups and the prioritization of research needs.

In the study of occupationally-related illnesses it is now important to assess the mutagenic and teratogenic effects on mothers and the mutagenic effects on fathers from reproductive hazards in the workplace. In the report of the NIOSH Work Group on Occupational Mutagenesis, Teratogenesis and Transplacental Carcinogenesis (November 5, 1976) and a report and recommendations for the Office of the Secretary DHEW on Occupational Health Problems of Pregnant Women (Vilma R. Hunt, April 30, 1975), recommendations were made to give high priority to the analysis of data already collected on pregnancy outcomes in relation to parental employment.

Through the publication of a sources sought synopsis (No. R-2-78) in the Commerce Business Daily on November 10, 1977, it was determined that a number of data sets are available for a study of pregnancy outcome in relation to parental employment. This project will abstract, code, computerize and analyze an existing data set, which includes among other elements occupational histories of parents and medical records of pregnancy outcomes, by a case-control approach to identify possible relationships between occupation and pregnancy outcome. Included in this project during FY 80 will be an effort to further investigate new surveillance methods for assessing reproductive effects, e.g., studies of infertility - clinic record.

3.0439,
FETAL MORTALITY STUDY

R. Kaminski, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-W11-519)

The National Center for Health Statistics (NCHS) has planned to conduct a 1978 National Fetal Mortality Survey in conjunction with the 1978 National Natality Survey. NIOSH would form an agreement with NCHS to collect on the questionnaries occupational information on the parents, particularly the mother in these surveys. (NIOSH would assure that NCHS adapts standard occupational questions such as those used by the Bureau of Census. The actual coding of the occupation and industry data would be carried out and conform to the classifications set forth by the Bureau of Census.) NCHS staff, along with NIOSH staff, would determine suitable analysis, plan, and write one or more of these reports. Also, detailed raw data tapes of this study will be provided to NIOSH for further analysis.

FY 79 ACCOMPLISHMENTS: Due to unanticipated obstacles, the actual surveys will not be conducted until 1980. A pretest is being conducted on 1978 deliveries (mailing during June 1979 through November 1979.) While the pretest is still in progress, it is anticipated that some changes in the questionnaire and mailing procedures will have to be made before the final survey.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $37,000

3.0440,
MORTALITY AND INDUSTRIAL HYGIENE STUDY OF SHIPYARD WORKERS EXPOSED TO RADIATION

B. Rinsky, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-629)

In a proportional mortality study conducted by Drs. Najarian and Colton, a significant increase in deaths due to neoplasms of lymphatic and hematopoietic tissues was reported among shipyard nuclear workers. The results of their study indicated that exposure to radiation at levels previously thought to be safe may be unsafe. NIOSH subsequently initiated a retrospective cohort mortality study.

As part of the study, approximately 27,000 civilian employees have been identified as having worked at the Portsmouth Naval Shipyard since 1954. To date, more than 3,000 deaths have been identified among the study population. The vital status will be determined from the remaining identified study population with death certificates retrieved and verified. A report of the in-depth industrial hygiene and health physics surveys (FY 79) will be drafted to address current and past occupational and chemical exposures to chemical and physical agents other than radiation. An exposure history will be compiled and assigned to appropriate job titles/locations.

A purchase order to Ted Colton has been made to purchase the results of his and Dr. Najarian's original study. NIOSH has supplied Dr. Colton with radiation values obtained from the Navy, and has had death certificates coded by a nosologist for his use in the reanalyses.

A review committee of outside consultants has been established to review the progress of the study. They have made trips to the shipyard and have familiarized themselves with the study protocol.

3.0441,
INDUSTRIAL HYGIENE AND MORTALITY STUDY OF CRUSHED STONE WORKERS

J. Costello, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKL-M21-908)

As a result of researchers finding asbestos fibers in crushed rock being quarried in Maryland, negotiations were started and are continuing with the National Crushed Stone Association to arrange for NIOSH to do national mortality study of workers in the crushed stone industry. Emphasis will be placed on causes of death related to cancer and pulmonary diseases.

As an integral part of this study, the Environmental Investigations Branch will examine and characterize the rock that is being quarried. There are four basic types of rock being quarried and each type will be covered by our sample.

Negotiations have continued with the National Crushed Stone Association resulting in walk-throughs in several quarries and data collection in five quarries. Arrangements have been made to collect data in three additional quarries in the next quarter.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $110,800

3.0442,
CROSS SECTIONAL INDUSTRIAL HYGIENE AND MEDICAL SURVEY OF NON-TEXTILE COTTON

M. Carlson, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKH-R22-208)

Continuation of FY 79 project. One-half of the selected sample has been studied. Contract portion has been terminated, and remainder of gin and warehouse sample will be studied with NIOSH personnel and equipment. This necessitates delaying the field study of cotton classification offices by one full year.

Purpose of the study is to establish prevalence of byssinosis and the dose-response relationship in the non-textile cotton industry (garnetts and mattress workers, cotton seed oil mills, waste utilization, warehouses, classification offices, gins). This will aid in setting environmental standards to protect workers in these industries.

3.0443,
MORTALITY STUDY OF WORKERS IN THE NORTHWEST PAPER, PULP AND PLYWOOD INDUSTRY - NCI

C. Robinson, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-617)

The purpose of this project is to follow up on leads supplied by state and national mortality statistics which indicate excess cancer among workers in the wood processing industries. Via contract, a retrospective cohort mortality study of workers in the Northwest paper, plywood and pulp industries will be conducted.

Recent mortality studies conducted by Samual Milham, Jr., M.D., show an excess of lymphatic and hematopoietic cancers in wood processing industry employees. Data developed under NIOSH Contract no. DC-99-74-26 entitled 'Occupational Mortality in Washington State, 1950-71' suggests that persons working in the plywood, paper and pulp industries may be at particular risk. Under this project the contractor will substantiate and refine the earlier occupational mortality findings. An effort will be made to localize any excess mortality within selected plants and to identify agents and processes associated with the increased mortality. The contractor will develop general historical environmental descriptions for each plant. In depth industrial hygiene surveys may be conducted if any excess mortality is observed.

The contract was awarded to Stanford Research Institute. Nine plants were selected for study including four plywood mills and five pulp and paper mills. Data on the study population has been collected, coded, and keypunched. After the data is edited and follow-up is completed, NIOSH will begin analyses of the mortality patterns of the study population.

3.0444,
MORTALITY AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO STYRENE - NCI

J. Beaumont, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C21-570)

Recently, information has evolved which indicates that workers exposed to styrene may experience chronic health problems: (1) There have been studies which show a definite increase in deaths due to leukemia among styrene-butadiene rubber workers. (2) Styrene has been shown to be mutagenic after liver microsomal activation. (3) Styrene oxide, which is a metabolite of styrene, has been shown to be mutagenic by the Ames test. Hepatotoxicity and carcinogenicity have been attributed to chronic exposure to styrene metabolites based on animal experiments. As a result of this information, a retrospective mortality study and industrial hygiene study of workers exposed to styrene is being conducted to further evaluate the potential medical effects of styrene.

Preliminary industrial hygiene and record assessment evaluations have been conducted at fifteen boat manufacturing facilities, both in and outside of the State of Washington, in order to judge the feasibility for their inclusion in the epidemiologic study. Two of these facilities in the State of Washington were identified as appropriate for the mortality study. In addition, five other facilities were chosen for industrial hygiene monitoring alone. A total of seven industrial hygiene surveys were carried out.

Demographic files have been coded and are being verified for the retrospective mortality study. Vital status follow-up has begun for all individuals who have worked at the two facilities which are part of the epidemiologic study.

3.0445,

REPRODUCTIVE AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO MW/RF ENERGY

B. Egan, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-W21-595)

The potential biological hazards of exposure to radiofrequency radiation are not yet clearly understood and remain the subject of worldwide study. Radiofrequency radiation has been implicated in a variety of biological phenomena including altered transmembrane potentials, increased membrane permeability, hyperthermia, hormonal imbalance, chromosomal anomalies, and mutagenic and teratogenic effects. Most of these studies have been experimental in nature. Very few human studies have been conducted to evaluate the chronic or reproductive health effects associated with exposure to radiofrequency radiation. This lack of human data is especially true in the United States. Several unconfirmed allegations have been made associating exposure to radiofrequency radiation with pancreatic cancer, brain cancer, leukemia and an increased incidence of birth defects and miscarriages. Unfortunately, the size of the population potentially at risk in most of these case reports has been too small to conduct a scientific evaluation of the situation. It is the intent of this project to define a population of workers who have been employed in work areas where there is exposure to radiofrequency radiation in order to evaluate whether their employment resulted in any increase in reproductive problems. Walk-through surveys are being conducted in the efforts to identify a study population. To date, the plants have been found to employ predominantly women in the heat sealing area. A control population of comparable size will be selected from the same facilities as the study group, but should be employed in work areas where there is no potential for exposure to microwave radiation or other potentially hazardous exposures.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $126,000

3.0446,

MORTALITY AND INDUSTRIAL HYGIENE STUDY OF LEATHER INDUSTRY WORKERS - NCI

F. Stern, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-634)

Several case-control studies have indicated that individuals employed in the leather industry may experience an excess risk of developing bladder cancer. Cole, in a case-control study, found that leather workers had a relative risk of 2 for developing bladder cancer when compared with a group of matched controls. Another case-control study conducted on all bladder cancer cases referred to the Roswell Memorial Park Research Institute, found a relative risk for bladder cancer of 12.94 for persons employed at least 5 years in the leather industry.

In an attempt to gain additional insight into the relationship between bladder cancer and the leather and leather products industry, mortality rates for bladder cancer were examined in those U.S. countries where the leather industry comprised at least 5 percent of the total employment of the country. Twenty-four counties in six states met these criteria. A definite pattern of increased bladder cancer was found in the 'leather counties' in New England and New York State, however, no unusual risks were found in the 'leather counties' of Pennsylvania and Tennessee. It should be noted that the leather industry in Pennsylvania and Tennessee consisted mostly of small-scale operations of the shoemaker-repairer trade, whereas the leather industry in New York and New England was mainly leather tanneries.

Leathermakers are potentially exposed to chromates, benzidine-based azo dyes and numerous other suspect carcinogens. In addition, NIOSH has recently detected environmental levels of dimethylnitrosamine in a leather tannery. Dimethylnitrosamine has been demonstrated to be an extremely potent carcinogen in numerous animal studies.

A cohort mortality/industrial hygiene study will be conducted to further evaluate the above-mentioned excess risk data. The first phase of the investigation will be a feasibility study to determine the extent of exposure, to characterize the work environment and to assess the feasibility of conducting the mortality portion of the study.

3.0447,

EPIDEMIOLOGY AND INDUSTRIAL HYGIENE STUDY OF ALUMINUM REDUCTION WORKERS

D.P. Brown, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-563)

Workers in the aluminum reduction industry are exposed to a variety of substances, hydrogen fluoride fumes, dust, carbon monoxide and coal tar pitch volatiles (CTPV) such as benz(a)pyrene. Coal tar pitch volatiles are released in the anode preparation area in plants using pre-baked anodes and in the pot lines where soderberg self-baking cells are used. The releease of CTPV is thought to be temperature dependent. Sufficiently high temperatures are reached in both anode preparation and electrolysis of aluminum to achieve the release of such materials. Thus, there is concern for the health of aluminum workers who may be exposed to carcinogens within CTPV such as BaP. Industrial hygiene surveys of the aluminum reduction industry have revealed levels of coal tar pitch volatiles well above the current occupational health standard of 0.2 milligram per cubic meter (mg/m3) by the benzene soluble fraction method. A variety of studies have been carried out to describe the cancer mortality experience of workers in aluminum reduction facilities. Milham (1976) has reported an increase in proportionate mortality from total cancer, cancer of the pancreas, cancer of the respiratory system and malignant lymphomas among aluminum workers in Washington State. In a study by Equitable Environmental Health, cause-specific standard mortality ratios, calculated for subgroups in the study population defined by major process, showed a positive association between employment as a potroom worker and lung cancer, leukemia, and lymphoma. In order to more fully define the specific cancer risk within the potrooms, a retrospective case control study is planned on aluminum workers exposed to CTPV. Industrial hygiene will assist in classifying job categories and in verifying related industrial hygiene data. The case control study will use existing data generated from the Equitable study. The uses and controls have been selected from the Alcoa plants and the work histories have been coded.

MORTALITY, MEDICAL AND INDUSTRIAL HYGIENE STUDY OF THE PAINTING TRADES - NCI

D. Zaebst, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-559)

NIOSH contract no. 210-77-0096 was awarded to Johns Hopkins University in October, 1977 to undertake a systematic investigation of the extent and nature of health effects occurring in populations engaged in the application of surface coatings.

The project presently is structured so that a carefully selected cross-section of industrial settings (wood furniture, railroad, aircraft, automotive, etc.) will be represented in the study, and similarly, so that a carefully selected cross-section of paint and coating systems (each with its own peculiar hazard potential) and application techniques will be evaluated.

The project consists of three closely interrelated phases: epidemiological studies, cross-sectional medical studies, and industrial hygiene studies. These three phases will be designed to evaluate respectively, mortality or morbidity experience of carefully selected populations engaged in paint application, the presence of clinical effects in these populations, and finally, (to the extent possible) present and past environmental exposure patterns in these populations.

As of September, 1979, walk-thru surveys were completed in a total of 48 plants or construction sites. Approximately 45-50 visits were planned in this phase of the project. An undetermined number of these sites will be selected for in-depth studies on the basis of findings during the walk-thru surveys. The decision was made to delay medical studies until guidance can be obtained for such studies based on results of in-depth industrial hygiene and epidemiological studies. This is reflected on the milestones projected for the fiscal year.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $58,000

3.0449,

MORTALITY AND INDUSTRIAL HYGIENE STUDY OF PCE WORKERS - NCI

D.P. Brown, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Surveillance Hazard Evaluations & Field Studies Division, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C21-547)

Perchloroethylene (PCE) is used extensively throughout the dry cleaning industry (100,000 workers). PCE has been tested for carcinogenicity in the Bioassay Program of the National Cancer Institute. The results of this experiment were similar to those seen with trichloroethylene - that is, an increase in hepatocellular carcinomas in mice. To date, the effects on humans from long-term low level exposure to PCE is unknown.

This study will assess the health effects from exposure to PCE by analysis of cause specific mortality among an identified group of dry cleaning workers. A cause of death for each individual in the cohort will be determined retrospectively and the observed deaths will be compared to those expected based on a standard race-, sex-, and age-specific population. Industrial hygiene surveys will be conducted by NIOSH to characterize worker exposure to PCE in the dry cleaning industry.

The Stanford Research Institute (SRI) is conducting the mortality study under contract. Personnel records from four labor unions have been used to assemble a cohort of approximately 1,650 dry cleaning workers who were employed for at least one year prior to 1960 in a facility where the primary solvent was perchloroethylene. All of the demographic and work history coding has been completed and vital status follow-up through the Social Security Administration has been accomplished. Once the SSA data is processed it will be determined how much more vital status follow-up is necessary.

Industrial hygiene surveys have been conducted in 30 dry cleaning facilities in San Francisco-Oakland, Detroit, and Cincinnati. An additional 15-20 surveys are planned in New York City and Chicago. The final I.H. report will be furnished in early FY 80.

MORTALITY, MEDICAL, AND INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO NITROSAMINES - NCI

J. Fajen, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-574)

Dimethylnitrosamine is labeled as a carcinogen by the Occupational Safety and Health Administration and therefore the few areas where it is used or manufactured, appropriate precautions are taken. It has only recently been discovered through the development of new analytical techniques, that dimethylnitrosamine and other nitroso compounds may form in the ambient atmosphere or even in vivo if sufficient concentrations of nitroso compound precursors (secondary amines, amides, etc.) and nitrates, nitrites or other nitrogenous compounds exist under the appropriate conditions.

Under the existing contract 28 plants have been investigated for total of 40 industrial hygiene surveys for possible nitrosamine contamination. The industries visited were the automobile, azo dye, small machine shops, fish and fish meal, rubber and leather. To date we have found N-nitrosodiethanolamine, N-nitrosodimethylamine, N-nitrosomorpholine and N-nitrosodiphenylamine in the air of several plants. N-nitrosodimethylamine, a regulated carcinogen, was found as high as high as 50 micron/cu.m in the lather industry. N-nitrosomorpholine was isolated in the rubber industry as high as 27 micron/cu.m. Ef-

forts were made to determine the nitrosating agent, source of contamination, the extent of human exposure and methods of controlling the exposure to nitrosamines in the rubber and leather industries.

MEDICAL, BIOMEDICAL AND INDUSTRIAL HYGIENE STUDY OF EMERGING PROBLEMS

R. Lemen, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C21-600)

Newly suspected hazardous occupational environments are continually being identified. This program is designed to quickly gather information about these environments and to initiate industrywide epidemiological studies, where warranted. This project also provides mechanism through which to respond to requests for assistance that are related to IWSB study areas.

The approach of this project generally will be to conduct literature searches, and field surveys to collect information to determine if epidemiological studies (environmental, morbidity and/or mortality) are feasible and where they are, to develop study protocols to carry them out. Requested assistance will be provided as required.

MORTALITY, MEDICAL, AND INDUSTRIAL HYGIENE STUDY OF BRAKE LINING WORKERS (NCI)

S. Leffingwell, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-C22-618)

The NIOSH recommended standard for asbestos exposure of 2.0 fibers longer than 5 microns per cubic centimeter of air was made with the recognition that: 1) health data were not available for exposures to low levels, and 2) definitive information on the biological response to different sized fibers was not available.

Industrial hygiene surveys have been conducted in eight automobile repair facilities by the Industrial Hygiene Section. Optical counting and electronmicroscopic analyses are being performed in order to characterize the nature of the exposures occurring in these types of operations.

A contract has been let to the Environmental Sciences Laboratory Mt. Sinai School of Medicine to evaluate health effects of exposure to asbestos-containing dusts in brakelining maintenance and repair. The contract consists of two evaluations: 1) a feasibility study, to locate a cohort of brakelining repair and maintenance workers with sufficient latency to conduct a retrospective mortality study of these workers; and (2) a cross-sectional medical survey, to define the current health status of a representative cross-section of workers occupationally exposed to brakelining dusts. In conjunction with the cross-sectional medical study, NIOSH has undertaken industrial hygiene assessments at representative sample of work establishments. The cross-sectional medical survey final report is due September 30, 1979.

The cross-sectional medical study had considerably lower participation than anticipated. Additional work will be required to characterize non-respondents.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $11,000

HEALTH EFFECTS EVALUATIONS DATA (HEED) FILE - PHASE II

E. Dacey, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-C11-576)

Section 20(a) (6) of the OSH Act charges NIOSH with the responsibility for evaluating the toxicity of chemicals used or found in th workplace upon written request from an employer or employee representative. Since 1971, the Hazard Evaluation and Technical Assistance Branch (HETAB) has performed these on-site toxicity determinations. Although the HETAB surveys are not statistically representative of the universe of worker population available for study, the results provide valuable information of the environmental and health status of the establishments surveyed. In the past two years, HHE and TA Reports from 1977 through June 1979 were complied. A new file design was implemented and analysis programs were constructed. A report on the HEED file was completed and submitted for publication during FY 79. It is proposed that FY 80 activities maintain the current abstracting coding from the HHE and TA Reports. In addition, new computer programs will be developed for the new HEED file structure. A report on the 1977-1979 HHE and TA Reports will be developed during the fiscal year.

IH STUDY OF INSULATION MATERIAL WORKERS - EPA

P. Herrick, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Divisson of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMH-E22-582)

Excess mortality from respiratory disease among insulation workers has been attributed to asbestos fiber exposure; however, the hazards associated with many other insulation materials have not been characterized. This project will determine by a literature search the quantities of the various insulation materials used in the United States, the number of workers potentially exposed to each material, and historic exposure levels. Current exposure levels of employees engaged in the manufacture and installation of two insulation materials will be determined through industrial hygiene surveys.

In FY 79 a literature review was performed, and a tripartite review meeting of representatives from industry, labor, and government was held. Polyurethane and urea formaldehyde foams were selected as the materials for study, and a list of manufacturers and installers to be surveyed was developed.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $15,000

DISABILITY CONDITIONS IN THE WORKPLACE-PHASE III - MINING

T. Fischbach, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMO-M11-575)

The purpose of this project is the development and implementation of activities to monitor the occupational and industrial characteristics of disabled individuals. Past accomplishments in our use of disability data have described the proportionate morbidity of disabled workers relative to their occupational characteristics. These activities have served as a basis for expanded cooperation between the Illness Effects Section and the Social Security Administration. Activities proposed during FY 80 will be directed toward an expansion of descriptive analyses (proportionate morbidity, categorical regression). In addition, the expansion of the data base to include data for 1975 and 1976 will facilitate analyses of trends for the period 1969-1976. A priority in forthcoming analyses will be the examination of disabilities in the mining industry.

EFFECTS OF SEGMENTAL VIBRATION ON CHIPPERS AND GRINDERS

D. Wasserman, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOG-G21-328)

This project will develop information leading to a comprehensive definition of permissible exposure limits to vibration impinging on the hands from the use of vibrating hand tools. NIOSH estimates that there are some 1.2 million workers in United States industries exposed to segmental vibration. An extensive field study has been conducted on vibration-exposed chipper and grinder workers who work at various foundry sites to determine the incidence and prevalence of Vibration White Finger Disease (Raynaud's Phenomenon) and workers' exposure levels. In FY 80 the field study data analysis will continue and be completed, followed by the publication of a comprehensive study report.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $15,480

3.0457,

NATIONAL COAL WORKERS' AUTOPSY STUDY

M. Martin, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKC-R24-138)

This project will provide support for the National Coal Workers' Autopsy Study (NCWAS). This support will consist of field work, autopsies, pathology and tissue analysis as necessary relative to mining disasters; publicizing the NCWAS to increase awareness of its existence and purpose; pathologic analysis of appropriate tissue blocks and slides of cases when consultations are requested; and the collecting and correlating of data relative to cases received through the Study.

Past accomplishments include administration of the Disaster Plan in several mining disaster situations, increased awareness of the Program through discussions with MESA officials, pathologists, funeral directors and other individuals involved with coal miner deaths and computerization of a large percentage of the cases received.

This project will benefit workers and their families in the coal industry.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $48,300

3.0458,

X-RAY/PATHOLOGY CORRELATIVE STUDIES IN PNEUMOCONIOSIS

F. Green, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKC-R22-244)

The chest radiograph is, at present, the best available method for diagnosis of occupational lung disease during life. It is also used for compensation purposes. The usefulness of a chest X-ray depends on how accurately it reflects the underlying pathologic processes in the lungs. In view of the importance of the chest radiographic in the pneumoconioses it is proposed to perform a study that will correlate the clinical chest X-rays on a series of coal miners with the pathological appearance of the lungs. A collection of material, unique to the United States, comprising 1,500 cases of autopsied miners has kindly been loaned to NIOSH by Dr. W. Laqueur for this study. This project should throw light on such important questions as the usefulness of the chest X-ray in diagnosing CWP, the relationship between emphysema, dust deposition, size and type of lesions and the X-ray.

The second year of the project will be primarily devoted to analysis of the data already collected.

Worker group affected is coal workers. They will benefit through the compensation system based on X-rays being more fair.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $131,000

3.0459,
MACHINE-PACED STRESS IN POSTAL WORKERS

M. Smith, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOB-B21-312)

This continuing project seeks to define job stress and associated health problems for the over 40,000 operators of multiple position letter sorting machines (MPLSM) in the U.S. Postal Service. Questionnaires were distributed to 6,000 MPLSM operators and 6,000 control subjects engaged in other postal jobs in the summer of 1979. The questionnaires dealt with job demands, workplace physical environment, psychosocial stress factors and health status. Data from the survey will be evaluated to determine relationships between job stress factors and worker health.

Coupled with the questionnaire survey are human factors evaluations of MPLSM work operations at 15 Postal Facilities distributed across the United States to pinpoint person/machine design deficiencies as well as to identify critical job demands influencing stress level. These human factors evaluations will serve to amplify work factors identified in the questionnaire survey as being stressful so that means for their elimination can be developed. A human factors checklist was developed in FY 79 and contracts awarded to two human factors experts to assist in this evaluation.

In addition to the above efforts, a longitudinal study of a small group (N equals 50) of MPLSM operators is underway. Medical, biological and psychological measures are being collected every six months to depict apparent stress and fatigue from letter sorting operations. This study is being conducted by the University of Wisconsin.

3.0460,
MORTALITY, MORBIDITY AND IH STUDY OF OIL SHALE WORKERS

J. Costello, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (033001TICNO)

The purpose of this project is to determine the health effects, if any, of occupational exposure to shale oil. The study cohort is made up of 713 men who worked at the Anvil Points Oil Shale Retort from 1948 to 1977. The study is divided into a mortality study, a morbidity study, and an industrial hygiene component. The mortality study will compare mortality patterns among the shale oil workers with an appropriate control group from the states of Colorado and Utah. The morbidity study will compare the morbidity patterns of 326 oil shale workers with a control group of 326 coal miners from the Colorado Plateau. A job history, respiratory questionnaire, and dermatological examination will be given to each of the people in the two groups. Special attention will be given to age, race, smoking, skin complexion, years on the Colorado Plateau, and time spent in outdoor activities. The industrial hygiene portion of this study involves workshops, health hazard evaluations of oil shale facilities and cooperative work with people in the Estonian Republic of the USSR who are engaged in oil shale health research.

3.0461,
MORBIDITY & INDUSTRIAL HYGIENE STUDY OF CEMENT WORKERS

H. Abrons, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKH-R22-193)

For at least 40 years there have been studies performed to detect evidence of lung disease in Portland cement workers. The most recent epidemiologic study completed in Yugoslavia indicates that cement workers show significant increases in pulmonary symptoms and decreases in pulmonary functions related to chronic obstructive pulmonary disease, as compared to controls. It is not known whether the results of the Yugoslavian study can be applied to cement workers in the United States. It is possible that the work environment in American cement plants is different enough to produce different results in a similar study.

Workers in the cement industry will be examined for evidence of both obstructive and restrictive (fibrotic) lung disease. Furthermore, personal dust sampling will be done at the study sites to develop 'dose-response' curves to the dust generated at the cement plants. Results will also be compared to the results of the 'Blue Collar' control worker survey soon to be initiated by NIOSH.

During FY 78, in consultation with union and industry, the study protocol was written. It received favorable peer review and was accepted by SPRG. Twenty-nine cement plants were selected as possible study sites, and are presently being visited to determine their suitability. Approximately 19 of these sites will actually be selected for study. Furthermore, a pilot study of dust level variability is being conducted to give insight into the amount of personal sampling that will need to be done in the industry-wide study. Pilot study has been completed. Analysis of dust exposure variability is proceeding.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $222,000

3.0462,
MAGNETOMETRY/PATHOLOGY CORRELATIVE STUDY OF COAL WORKERS' PNEUMOCONIOSIS

F. Green, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKC-R22-165)

Magnetometry is a technique that can be used to measure ferromagnetic contamination in the lungs. Coal dust contains approximately 0.1 percent Fe 304 or magnetite and this is large enough to be quantitated by magnetometry. Pilot studies on retired coal miners with coal workers' pneumoconiosis (CWP) and on lungs from coal miners removed at autopsy have shown that the technique is at least as sensitive as radiography in determining the amount of dust in the lungs. It has distinct advantages over radiography in that the technique is safe and non-invasive and can be used to measure dust retention and dust clearance over a period of time. The latter may help us to identify those miners who are retaining excessive amounts of dust and who are presumably more likely to develop CWP. Mangetometry thus could become an important tool for preventive medicine.

This study is designed to correlate the amount and distribution of coal dust (performed by Dr. D. Slatkin, Brookhaven Natl. Labs.), iron content, histopathology and radiology of selected freeze-dried lungs from miners and controls with the magnetometric measurements. The latter is performed by a consultant (Dr. A. Friedman, Philadelphia, Pa.).

The overall objective of the study is to establish a firm scientific basis for the use of magnetometry as a measure of CWP and thus hasten its application to clinical situations.

In the final year of this project correlations will be made on 20 freeze-dried lungs and the results will be submitted for publication in a reputable journal.

Workers in the coal industry will benefit from this project through its contribution towards the development of non-invasive methods for measuring lung dust burden.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $41,940

3.0463,
MORTALITY STUDY OF DIESEL ENGINE MECHANICS

J. Costello, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKL-R22-228)

A few years ago a suggestion was made to introduce diesel powered equipment into underground coal mines to replace electrically operated equipment. Labor unions expressed concern about this in terms of both health and safety. NIOSH held a conference in September, 1977, to determine what was known about health effects of diesel exhaust. One recommendation of this conference was for NIOSH to look at a large population of workers who had been exposed to diesel exhaust in confined spaces for an extended period of time.

Diesel engines have been found to emit polynuclear aromatic hydrocarbons. Among these emitted polynuclear aromatic hydrocarbons are found benzo(a)pyrene (BaP) and benz(a)anthracene (BaA) which are known to be carcinogenic. Work by Carnow and others suggests that an increase of 1 mg/cu.m meter B(a)P in urban pollution is associated with a 5% increase in lung cancer death rate. Battigelli and others in 1963 looked at 210 workmen exposed to diesel exhaust in railroad engine houses and found that there was no significant difference in pulmonary function between these workers and a control group. However, the maximum latent period was 15 years with an average of 10-year exposure and the study group was small.

Railroads began dieselization in earnest after the Second World War and by 1953 were well on the way toward complete dieselization. We now have a maximum latent period of 24-plus years which should be long enough to show evidence of lung cancer, if it exists, in these workers. This project will look at mortality patterns of a large group of workers in railroad diesel engine repair shops (and other diesel repair shops) where it is common practice for engines to be left running for adjustments. Particularly in inclement weather the shop doors are closed and inadequate ventilation may result. We will pick a sample of the larger shops in the eastern United States for this project.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $20,000

3.0464,
CROSS-SECTIONAL EPI & IH STUDY OF NEW AND EX-MINERS

J. Hankinson, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKH-R22-163)

The project is designed to answer the basic question: 'Are those miners who have already left the coal mining industry different from those who remain?' This question will be answered by investigating 'new miners' (those miners who work only for a few years and quit) and 'ex-miners' (those miners who worked for many years and quit). The ex-miners will be investigated by comparing data collected in the first and second rounds of the National Coal Study. During the first year of this project, we investigated those miners who participated in Round 1, but not in the second round, to determine if they actually left the industry. Data from those who left will be compared with a matched group who remained. This will require no new data collection.

The overall purpose of the 'new-miner' study is to determine if new miners develop acute changes in their lung function with dust exposure. The 'new-miner' study will be divided into two phases. Phase I will consist of a detailed analysis of those miners who participated in the third round of the National Coal Study with less than 18 months of employment. These miners will be compared to a normal non-miner control group and a group of miners with more than five years exposure to coal mine dust.

Phase II of the 'new-miner' study will consist of the repeat examination of approximately 100 miners with less than one year of employment. Their initial examinations will be conducted before and after a work shift. Follow-up examinations will be conducted at 6-month intervals for approximately two years. During

FY79 initial examinations were completed on approximately 120 new miners.
SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $78,900

3.0465,
IMMUNOGENETICS OF BERYLLIUM DISEASE IN HUMANS

S. Olenchock, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKC-C23-180)

The continuation of this project is designed to survey and analyze the HL-A antigenic determinants on cells from patients with beryllium disease in an attempt to demonstrate possible genetic relationships with disease. These results will be compared with HL-A antigenic determinants on cells from patients with sarcoidosis in order to investigate possible genetic similarities or dissimilarities between individuals with either disease. Individuals in the following populations will be studied: patients with chronic beryllium disease, beryllium workers without disease, patients with sarcoidosis, and appropriate geographical controls with no pulmonary disease.

A questionnaire will be administered to volunteer subjects, and whole blood will be obtained by venipuncture and the cells analyzed for HL-A determinants and blood grouping. Split blood specimens from appropriate test and control sample populations will be utilized to measure MIF production by leukocytes for evaluation of specific hypersensitivity to beryllium compounds. In addition, serum will be examined for total immunoglobulin and C4/3 levels, and the following traits: alpha-1-antitrypsin levels, anti-nuclear antibody, rheumatoid factor, and immunosuppressive/regulatory activity.

During this final year, all follow-ups and secondary evaluations will be completed and all data will be collated, analyzed, and published.

WORK GROUPS AFFECTED: Beryllium plant workers; sarcoidosis patients.

BENEFIT TO WORKERS: Genetic susceptibility to disease. Predictability to getting disease. Modification of clinical test to determine degree of hypersensitivity.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $60,300

3.0466,
MORT/IH STUDY OF WORKERS IN COAL FIRED POWER PLANTS - TVA - EPA

C. Ortmeyer, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKL-E21-238)

Pulmonary disease and impairment such as airway obstructive diseases and pneumoconiotic lesions, could arise in part from exposures to gases emitted during coal combustion and to coal dust when coal is burned as fuel for steam-powered electricity generating plants. Those workers who handled the asbestos sheets used to insulate steam pipes may also show evidence of health damage - asbestosis or malignancies. In order to conduct research on occupational safety and health problems of TVA employees a memorandum of understanding between NIOSH and TVA was signed in 1976 specifying overall responsibilities for cooperative studies.

Sub-Agreement I, under this memorandum established industrial hygiene studies of workers in coal-fired power plants. The TVA will conduct detailed cross-sectional industrial hygiene studies of workers in selected occupations. Existing industrial hygiene data on past exposures, along with information on control methods will be reviewed in order to retrospectively estimate cumulative working lifetime exposures in occupations where there has been exposure to the same particulates or gases. This information will be used to attempt dose assessment for mortality studies of workers exposed to the same pollutants in the past. The Environmental Investigations Branch will monitor all stages of this study.

Sub-Agreement II, Epidemiological Mortality Study of TVA Employees, is being carried out to estimate the effects in terms of higher-than-expected death rates and/or early retirement due to disability involving principally cardiopulmonary disease or specific malignancies linked to earlier exposures to air contaminants in the workplace environment. All permanent male employees of the TVA with 5 or more years of employment (at least 2 of those years consecutive), and employed sometime between 1-1-55 and 12-31-72 will be included in the cohort for the study.

Required demographic data (age, sex, etc.), most recent and previous addresses, detailed work histories within TVA, and information about dates and causes of death or of early retirement will be obtained. The TVA will assemble and computerize all data from TVA record files for both active and retired employees from the earliest work histories through 12-31-77. (Text Abridged.)

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $83,100

3.0467,
DELAYED NEUROTOXICITY OF ORGANOPHOSPHOROUS EXPOSED WORKERS

C. Cottrill, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Surveillance Hazard Evaluations & Field Studies, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VMR-G21-610)

Recent findings in workers exposed to certain organophosphorous chemicals have shown that irreversible damage to the nervous system (upper motor neuron lesions) with possible irreversible paralysis and central nervous system damage may occur from chronic low level exposure to these chemicals. This project seeks to explore potential neurological damage in workers exposed to organophosphorous chemicals, such as aryl and alkyl/aryl phosphates.

The major research effort will be directed to evaluating multiple exposure of workers. Concurrently with a medical/neurological evaluation a comprehensive industrial hygiene evaluation of the work environment will be conducted. Exposed workers (N equals 200 from one or several plants) and control workers (N equals 100) will be examined. Functional measures will include electrophysiological, psychological, neurological, and clinical biochemical assays. Statistical analysis of the data will consider multiple exposure conditions at the work-site and any relationship to delayed neurotoxicity in workers.

Research findings will be used in the development of recommended criteria documents and will be critical in preventing irreversible nervous system damage in workers exposed to chronic low levels of organophosphorous chemicals.

Previous studies with leptophos suggest a delayed neurotoxic effect of leptophos (possibly through increased percutaneous absorption in the presence of organic solvents such as n-hexane and styrene) resulting in upper motor neuron lesions (possibly irreversible). Previous studies have indicated a delayed neurotoxicity in workers exposed to organophosphorous compounds, specifically tri-aryl phosphates. All necessary clearances have been obtained, and site and cohort selection are proceeding.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $131,000

3.0468,
STUDY OF NOISE/HEARING IN PAPERWORKING IN INDUSTRY

R. Tubbs, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Biomedical & Behavioral Science, *4676 Columbia Pkwy., Cincinnati, Ohio* 45226 (VOG-G22-364)

This study critically examines the hearing levels and daily noise dose of workers in the paperworking industry (at the request of the United Paperworkers International Union) where non-steady state noise is said to exist. The Union estimates that approximately 700,000 paperworkers fall into this type of noise exposures. The hearing levels of approximately 2,500 paperworkers and control subjects have been tested to date by NIOSH and recording of daily noise exposures of selected workers performing a variety of paperworking jobs have been obtained.

A critical analysis of both the audiometric and exposure data will be performed and correlated. Subjects will be separated into groups according to general patterns of noise exposures to ascertain if different patterns of noise with equal intensity levels yield equal amounts of hearing losses.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $57,220

3.0469,
DOCUMENT DEVELOPMENT

I. Baumel, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Criteria Documentation & Standards Development, *5600 Fishers Ln., Room 3-32, Rockville, Maryland* 20852 (VID-D50-089)

Following literature surveys, critical reviews of information relevant to industrial hazards are prepared. These reviews consider such information as extent of hazard, effects on humans and on animals, epidemiologic information, correlation of exposure and effect, methods of sampling and analysis of workroom atmospheres, engineering controls, and work practices. Recommendations for control of these hazards, based upon this information, are prepared. Following Institute approval, these criteria and, where appropriate, recommended Federal standards, are forwarded to the Occupational Safety and Health Administration for information purposes and for consideration in promulgating occupational safety and health standards.

Approximately 100 criteria documents have been prepared since 1971. Most of the preliminary draft documents have been prepared under contract and then subjected to a thorough review process. During the third quarter of FY79 three contracts were awarded for the delivery of twenty-one documents with initiation and completion of documents distributed from June 25, 1979 to June 24, 1981. Funding is included under this project for completion funding of these contract. However, during FY 80 new procedures will be implemented such that the documents developed under contract may appear in a format more highly differentiated and evolved than in the past. Each document will be examined on a case by case basis to determine whether it would be most appropriately disseminated as a brief guideline, a special hazard review, an occupational hazard assessment, a full recommendation for a Federal standard or any other form.

New contracts for traditional criteria documents will be initiated during FY80. Development of most documents will continue in-house as existing contracts are phased out. However, contracts will be negotiated during the year to supplement these in-house efforts especially in the literature searching and data gathering phase of document work.

PATHOLOGY STANDARDS FOR ASBESTOS INDUCED RESPIRATORY DISEASE

F. Green, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKC-R21-246)

This project is designed to provide pathologic standards for asbestos induced respiratory disease. Standards are required for the following reasons: 1) To improve communication between clinical scientists working in this area; 2) To enable comparison between different cases or series of cases as regards type of exposure and severity of the disease processes; 3) To facilitate the mechanics of legislation in the area of asbestos related disease. The following disease processes will be categorized and standardized: 1) Pulmonary fibrotic lesions; 2) Pleural placques; 3) Bronchial lesions; 4) Emphysema; 5) Vascular lesions; 6) Bronchial neoplasms; 7) Pleural neoplasms. The project will also attempt to define asbestos fibers and specify how they can best be identified in tissues and will define the appropriate methods for handling and processing lung specimens for asbestos study.

The project will be done on contract by an expert panel of pulmonary pathologists. It will help workers in the asbestos industry, by enabling more accurate diagnosis of the disease.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $14,100

I.H. CHARACTERIZATION OF RESOURCE RECOVERY INDUSTRY - EPA

S. Berardinelli, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKP-E22-226)

The resource recovery facilities operational or under construction in the U.S. are projected to replace in excess of 7 percent of the fossil fuels used for electric power generation. Previous assessment studies conducted in DRDS indicate the need for an in-depth occupational environment characterization of these facilities. Emphasis will be on airborne pathogens, toxic chemicals, physical agents (noise and heat primarily), and the nature and significance of particulates and gaseous emissions.

The purpose of this contract is to more fully define occupational health problems in the resource recovery industry. Detailed occupational health assessments will be made to: quantify health problems through an industrial hygiene survey; define necessary programs including the feasibility of a retrospective cohort mortality study, medical surveillance, including a cross-sectional morbidity study, pre-employment physical and periodic medical examinations; evaluate the feasibility and desirability of development of a criteria document; and recommend control procedures and areas for control technology development.

3.0472,

MORBIDITY & MORTALITY & INDUSTRIAL HYGIENE STUDY OF WORKERS EXPOSED TO WOOD DUST

J. Gamble, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKL-R21-245)

Although man has been in daily contact with wood from time immermorial, and has regarded it as entirely innocuous, exposure to wood and wood dust may be hazardous. Exposure to wood and wood dust can produce irritating allergenic and carcinogenic effects. Signs and symptoms that have been associated with exposure include dermatitis, irritation of mucus membranes and conjunctiva, sinusitis, cough, rhinitis, asthma, chronic pneumonitis, reduced diffusing capacity, chronic bronchitis, and adenocarcinoma of the nasal cavity and sinuses. A variety of wood species have been implicated and include a number of exotic woods (or associated micro organisms), cork dust, cedar,sequoia, oak, maple, pine, poplar, birch, dogwood, beech, mahogany, and mulberry. Occupations range from lumbermen and sawmill operators to those exposed to finer dust (furniture makers, carpenters, violin makers, and other wood workers). Further work is needed on the extent of the problem, particularly on occupational asthma and nasal cancer, and the specific constituents producing disease.

Accomplishments: Walk-through surveys of different segments of the industry have been completed.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health $83,000

3.0473,

3RD ROUND NATIONAL STUDY COAL-WORKERS' PNEUMOCONIOSIS

D.M. Attfield, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, Division of Respiratory Disease Studies, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505 (VKL-R22-183)

NATIONAL COAL MORBIDITY STUDY: This project involves both the cross-sectioned and longitudinal study of a large group of nationally distributed coal miners. Many of the coal mines in the project have been or will be visited twice at an interval of about 8 years. This affords excellent opportunity for the study of pneumoconiosis and other disease processes over this period. At present, 13 mines have been visited. To date participation rates have been variable, and generally disappointing. At the majority of mines the participation was so low as to make results from those places of doubtful value. The concern that arose from this lead to a temporary halt in this project while discussions were held to assess the best way to improve turnout. The decision following various meetings was to visit 3 more mines using enhanced procedures for getting the miners to attend, and at the third, to schedule miners on company time. After this further evaluation of the future of the project will be made. Arising from this problem and also from problem with Field Team staffing, plans for the next fiscal year are rather tenuous.

COAL MORTALITY STUDY: This project has two goals. The first goal is to complete a follow-up on the mortality, 1969-1977, of 9078 bituminous underground miners examined in the first round of the National Coal Study, 1969-71. Part of this goal, not yet accomplished, is to supplement this cohort with samples from the mines whose radiographs were obtained in the first round of radiographs (and related data) in Receiving Center files. The second goal of the project is shown with the 'Mortality Study of Workers in Coal Fired Power Plants--TVA': to develop and pretest mail and telephone survey procedures in order to update job histories and histories of cigarette smoking and to determine more valid histories of cardiopulmonary diseases, especially those likely to be due in part to contaminants in work place air.

INVESTIGATION OF THE INFLUENCE OF HORMONAL CONTRACEPTIVES ON THE CYTOLOGY OF THE CERVIX AND ON OUTCOME OF PREGNANCY

G. Zarcovic, Inst. of Hygiene & Social Medicine, *Sarajevo, Yugoslavia* (02-603-F)

One portion of the study is attempting to determine whether there is any relationship between oral contraceptive drug use and abnormal Papanicolau smears or cervical histology by comparison with a control group using mechanical contraceptives. The second portion of the study will seek to determine whether any relationship exists between oral contraceptive drug use and the occurrence of congenital anomalies in offspring.

Since the mission of the Food and Drug Administration is consumer safety, it is hoped that this study will contribute to our knowledge of the effects of oral contraceptives.

GIARDIA LAMBLIA - RECOVERY FROM HOSTS AND FOODS, IDENTIFICATION AND EXTENT OF INFECTIVITY

W.A. Kasprzak, Akademia Medyczna w Poznaniu, *Przybyszewskiego 49, 60355 Poznan, Poland* (05-639-F)

Giardia lamblia is a parasitic protozoa known to cause severe epidemics of diarrhea and gastrointestinal disease when its cysts contaminate sources of drinking water. However, little is known about the transmission of non-epidemic giardiasis whose incidence in the human population may be quite high. The major purpose of this study is to determine whether non-epidemic giardiasis may be transmitted by foods and whether there are reservoir hosts. Results will be utilized to make food safe for human consumption.

DETECTION AND CONTROL OF BACILLUS CEREUS

S.M. Harmon, U.S. Dept. of Health & Human Services, Public Health Service, Food & Drug Admin., Bureau of Foods, *200 C St. S.W., Washington, District of Columbia* 20204 (10093)

STATEMENT OF OBJECTIVE: To develop and evaluate methods for detecting B. cereus and its enterotoxin(s) in foods and to determine the rates of survival and growth of this organism under conditions which simulate cooking and handling of foods.

DESCRIPTION OF WORK: Characterization of food poisoning strains of Bacillus cereus: The characterization of B. cereus strains isolated from foods associated with food poisoning, which was initiated in FY 80 will be continued. The cultural and biochemical characteristics of several strains of B. cereus associated with food poisoning outbreaks will be determined and the results compared with those obtained with B. cereus strains derived from other sources. It has been assumed, but not conclusively demonstrated, that the B. cereus strains associated with food poisoning are merely typical B. cereus strains that have the capability of producing B. cereus enterotoxins. In this study, a variety of cultural and biochemical tests will be applied in order to determine whether the diarrheal or emetic strains of B. cereus exhibit unique cultural or biochemical characteristics, and whether the different strains associated with each type of illness are similar.

The studies will form the basis for subsequent testing of B. cereus isolates for their ability to produce diarrheal enterotoxin.

Testing of B. cereus strains for diarrheal enterotoxin: The Division of Microbiology is attempting to develop a serological method(s) for detecting and quantitating the diarrheal enterotoxin produced by B. cereus. This work has been delayed because of technical difficulty in producing purified enterotoxin under an extramural contract. Therefore, the initiation of this work is contingent upon successful purification of the enterotoxin and the development of an appropriate serological technique for detection of the toxin. The serological method will be evaluated for it applicability for detecting and quantitating the diarrheal enterotoxin produced by food poisoning strains of B. cereus. The method will also be used to determine whether other biotypes of the B. cereus group such as B cereus var. mycoidas and the closely related insect pathogens B. thuringiensis can produce diarrheal enterotoxin.

Collaborative study of differential tests for B. cereus: A collaborative study will be conducted in 10 laboratories to determine the utility of a new set of differential tests for distinguish (Text Truncated - Exceeds Capacity)

HEALTH SIGNIFICANCE OF FOODBORNE PARASITES

J.W. Bier, U.S. Dept. of Health & Human Services, Public Health Service, Food & Drug Admin., Bureau of Foods, *200 C St. S.W., Washington, District of Columbia* 20204 (04137)

STATEMENT OF OBJECTIVE: Determine the incidence and pathogenic potential of parasitic animals that occur in foods and in food-contact materials such as sewage recycled in the form of fertilizer or animal feed. Study methods for the recovery and inactivation of parasites in the food chain. Prepare general and technical articles on the safety of foods with respect to parasites.

DESCRIPTION OF WORK: 1. Roundworms, Protozoa and Salmonella. Infections with these parasites may be transmitted through the food chain by crops grown on land that is contaminated by fecal wastes. The land disposal of sewage and sludge is increasing due to Environmental Protection Agency regulations restricting water dumping and burning products

of municipal, industrial, and agricultural wastes. Eggs of roundworms such as Ascaris and Trichuris spp. are the longest surviving pathogens in sewage, soils and on crops. Methods for monitoring for these roundworms were collaboratively studied in FY'79. The Division of Mathematics recommended that the method used be compared with another method because of large variability in results within and between participating laboratories. Two methods will be compared in a collaborative study this year. In addition, data on the background incidence of parasite organisms on fresh vegetables will be monitored. Six vegetables will be sampled and checked for parasitic eggs by microscopical examination, and of protozoan cysts and Salmonella app. bacteria by culture methods. Vegetable samples will be collected by contract and split samples shipped to six district laboratories for parasite and Salmonella analysis and to Minneapolis Center for Microbiological Investigations for analysis for protozoan cysts. 2. Fishborne Parasites. Due to increasing consumption of raw and semiraw fish, human anisakiasis is being reported in the United States. FDA has already accomplished much work on these parasitic nematodes; however, some problems remain to be solved. A survey of Hawaiian fishes which commenced 2nd Quarter FY-80 will continue. The second year of a flatfish survey (First yr., FY'78) will be completed by Boston District; headquarters identify nematodes collected by the districts. Development of procedure manuals for the biochemical identification of anisakines in seafoods will continue (contract). Trematodes, Salmonella and Shigella (Text Truncated - Exceeds Capacity)

CLINICAL STUDY OF NUTRIENT TOXICITY

Y.K. Park, U.S. Dept. of Health & Human Services, Public Health Service, Food & Drug Admin., Bureau of Foods, *200 C St. S.W., Washington, District of Columbia* 20204 (12088)

STATEMENT OF OBJECTIVE: To study the incidence and severity of nutrient toxicity in a selected metropolitan area of the United States.

DESCRIPTION OF WORK: Initial efforts will be directed at identifying individuals who consume large levels of nutrient either individually or in combination. These studies will be identified from patients entering the medical center for all causes by reviewing information on dietary practices and through the use of screening techniques. Identified subjects will be asked to volunteer for further testing and evaluation to determine the extent of any biochemical, physiological, immunological, behavioral and other changes in body parameters. Efforts will also be devoted to determine demographic characteristics of individuals showing evidence of nutrient toxicity so that such information can be used for selecting future subjects from community segments.

MENOPAUSAL HOT FLASH

A.M. Voda, University of Minnesota, Minneapolis Campus, School of Nursing, *122 Owre Hall, Minneapolis, Minnesota* 55455 (R01 NU 00872-01)

This study is an extension of an ongoing study of menopausal women who have hot flashes. The specific aim of this second menopausal hot flash project is to further the work begun in phasse one by adding to the description of the woman who has hot flashes. SpecificaLLY, work will be done to quantify the hot flash through measurement of thermal and vasomotor changes, to assess the body composition of menopausal woman with and without the flashes, to evaluate the factors considered when decisions are made whether or not to use estrogens for relief of hot flash, and to estimate the prevalence of hot flash in menopausal women in a metropolitan area.

To accomplish the specific aims, the profect has been divided into 3 phases, physiological, epidemiological, and ethnographic. The physiological phase will utilize experimental methodology to further characterize the woman who flashes, to quantify the hot flash, and to determine differences in thermal, vasomotor, and body composition of flashing vs. nonflashing women. The epidemiological phase will utilize house-to-house survey methods to estimate the prevalence of hot flash in the community. The ethnographic phase will utilize basic exploratory methodology through ethnosemantic method of interview to add to the description of the woman who has hot flashes, and to determine what differences there are, if any, among 1) women who have hot flashes and do not take estrogens; 2) women who have hot flashes and take estrogens and 3) women who do not have hot flashes.

CESAREAN SECTION - EFFECT ON FUTURE PREGNANCY AND OUTCOME

V.M. Lognillo, State Dept. of Health, Office of Biostatistics, *Empire State Plaza, Tower Bldg., Albany, New York* 12237 (MC-R-360446-01)

The vital statistics registration system of the New York State Department of Health is to be used in a prospective study of the effect of cesarean section on subsequent reproductive experience. All women having a primary cesarean section during 1975 in upstate New York (New York State exclusive of New York City) will be identified, as will a set of matched controls that gave birth vaginally. These women will be followed for five years, using vital records data, and compared with respect to frequency, spacing, and outcome of their subsequent pregnancies. Maternal and perinatal mortality and morbidity measures will be used as outcomes, with vital records data to be augmented with data from hospital records. Comparisons will also be made among the cases (index event of a primary cesarean section) between those that deliver vaginally and those that deliver via repeat cesarean section on subsequent pregnancies to determine both the outcomes (both maternal and perinatal) and the prevalence of vaginal deliveries subsequent to a cesarean section.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, Health Services Admin., Bureau of Community Health Services $47,198

3.0483,
DEMOGRAPHIC INFLUENCE OF ANNUAL DOWN SYNDROME BIRTHS

C.A. Huether, University of Cincinnati, McMicken College of Arts & Sciences, Dept. of Biological Sciences, *Van Wormer Adm. Bldg., Room 204, Cincinnati, Ohio* 45221 (MC-R-390453-01-0)

The principal objectives of this research are to: (1) help clarify the continuing role U.S. demographic changes are playing in determining the incidence and number of Down Syndrome (DS) live births, and (2) develop a demographic model which projects, for the period 1980-2000, the number of DS live births expected to be born annually in the U.S.

Ideally, the validity of the model would be tested by comparing with the number of annual DS births observed in the U.S. Since these data do not exist, the model will be tested against the number of annual DS births observed in the state of Ohio for the period 1970-78. Existing Ohio data are known to be grossly underreported; however, by using the large number of patients known to be DS through chromosome analysis, an accurate estimate of underrreporting will be obtained. Thus, a realistic estimate of the number of DS births occurring in this state will be obtained (objective (3)), and will be compared to the expected number generated by the model.

As aminocentesis for advanced maternal age has been increasingly utilized during the decade of the seventies, data will also be gathered on the number of aminocenteses performed for this period in Ohio (objective (4)). This will allow modification of the model to include the impact of this procedure.

Assuming the ultimate model sufficiently accurate, it will be utilized for projecting annual DS births for the rest of this century on a national level, using known population age structure and Census Bureau ASBR projections. Knowing the number of DS births to expect should prove useful to public health planners, for example in attempting to provide preventative measures such as aminocentesis and education.

SOCIOECONOMIC DIFFERENTIALS IN INFANT MORTALITY

E.G. Stockwell, Bowling Green State University, School of Arts & Sciences, Dept. of Sociology, *Bowling Green, Ohio* 43402 (MC-R-390452-01-0)

Using the census tract of mother's usual residence as the basic unit of analysis, this project will examine the relationship between infant mortality and socioeconomic status in four metropolitan centers in Ohio (for 1959-61 and 1969-71) and two in Arizona (for 1969-71). The dependent variables will be infant mortality rates (total, neonatal, and postneonatal), calculated separately by race and cause of death; and the independent variables will be several common indexes of socioeconomic status. The relationship between dependent and independent variables will be analyzed using multivariate techniques. The results of this analysis will contribute to a better understanding of the role of specific socioeconomic factors underlying observed differences in infant mortality.

EARLY MALADAPTATION - A PROSPECTIVE, TRANSACTIONAL STUDY

B. Egeland, University of Minnesota, Minneapolis Campus, School of Education, Dept. of Psychoeducational Studies, *Burton Hall, Minneapolis, Minnesota* 55455 (MC-R-270416-03-0)

Important issues in developmental/risk research are being addressed through a longitudinal study of a broad-based sample of infants. The original sample consisted of 267 infants and their families from the Minneapolis Health Clinics. A high proportion of risk in this sample is suggested by a variety of factors including neonatal assessments of the infant and assessments of mother's expectations, understanding, feelings and interest in her young child, as well as her age, lack of family support and basic caretaking skills. Competence assessments at the end of the first year (effectiveness of the attachment relationship) confirmed the degree of risk in the sample and also demonstrated that the entire range of quality of adaptation is encompassed.

The purpose in continuing to follow this sample through the preschool years, is to examine the continuity of quality of adaptation, the relation between early care on early competence and later developmental problems, the impact of stress, and the continuing interaction of maternal and child factors. The basic strategy involves the assessment of competence with developmentally appropriate measures, each of which taps the capacities of the child for coordinating adaptive responses. Quality of attachment was assessed at 12 and 18 months, problem-solving styles at two years and currently the child's flexibility and impulse control are being assessed, and at 4 and 1/2 years social competence will be assessed. The assessment procedures have all been the subject of considerable validation research, and some evidence for developmental links between them has been obtained for non-risk populations.

EPIDEMIOLOGICAL ASPECTS OF AMEBIASIS AMONG MALE HOMOSEXUALS RESIDING IN THE SAN FRANCISCO BAY AREA

H. Ortega, U.S. Dept. of Health & Human Services, Public Health Service, Hospital, Microbiology Service, *15th Ave. & Lake St., San Francisco, California* 94118 (SFO 80-46)

This study is an attempt to establish the prevalence and incidence of amebiasis among a selected male population during a one year period. The results of this investigation will be evaluated for possible public health problems.

The patients included in this project are primarily male homosexuals between the ages of 16 and 60, who are seeking medical care for enteric disorders.

Some asymptomatic male homosexuals and male heterosexuals will be included.

A questionnaire is provided for elucidating the relationships between clinical history and laboratory findings. Fresh stool specimens will be concentrated using formalin-ether. When necessary, a portion of the stool emulsified in polyvinyl alcohol will be trichrome stained.

Any abnormal exudates found on proctoscopy are freshly smeared on slides, fixed in Schaudinn's and similarly stained.

Follow-up studies include appropriate physical examinations and laboratory studies.

All data will be analyzed for correlations between specific sexual practices and positive laboratory findings in attempting to elucidate the mechanisms of infection.

CHRONIC SEQUELAE OF NON-A, NON-B HEPATITIS

J. Hoofnagle, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Clinical Center, Immunology Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 CL 02010-06 BB)

All patients developing non-A, non-B hepatitis following open heart surgery will be followed with serial studies of SGPT to determine the incidence of chronic liver disease and to compare this incidence with those having type B hepatitis. Liver biopsy will be obtained when the SGPT is elevated for more than 6 months and then again at one and three years. Biopsy material will be obtained for fluorescent and EM studies, as well as light microscopy with multiple stains.

THE DUFFY BLOOD GROUP DETERMINANT AND SUSCEPTIBILITY TO MALARIA

L.H. Miller, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Clinical Center, Immunology Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 CL 02011-06 BB)

Working with an in vitro model for invasion of red cells by malaria merozoites, this study has demonstrated that human red cells lacking the Duffy a and b antigens are resistant to invasion. This corresponds well with epidemiologic studies which show that approximately 70% of West African and American blacks are resistant to Vivax malaria. A similar proportion of these blacks are Duffy a and b negative whereas the Duffy negative genotype is extremely rare in other racial groups. The close association between the Duffy negative genotype and resistance to Vivax malaria has also been confirmed by retrospective analysis of 11 volunteers experimentally inoculated with P. vivax. A retrospective study of U.S. servicemen who contracted malaria in South East Asia has been completed and confirmed again our original hypothesis. A second study conducted by CDC in Honduras has also been completed and is another in-vivo study in-proof.

CONSULTING SERVICES

G.H. Weiss, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Div. of Computer Research & Technology, Physical Sciences Laboratory, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 CT 00022-13 PSL)

Members of the PSL provide consulting services in different areas of applied mathematics and the physical sicences to researchers at NIH and elsewhere. We have continued research on different interpolation methods in computerized tomography, in particular developing the theory of phantom views which has been found to diminish some artifacts in image reconstruction. Another research area has been the demonstration that generalized functions can be used to simplify calculations of joint distributions of order statistics and moments for arbitrary probability distributions. We have completed work and furnished a solution to combinatorial problems of considerable difficulty that arise in pharmacology. A joint project was started with members of the clinical center on the quantitation of audiometric methods, with specific application to diagnosis of osteogenesis imperfecta. Further epidemiological investigations were made on a data base of 1221 head-injured Vietnam veterans, with particular emphasis on post-traumatic epilepsy.

STATISTICAL RESEARCH IN CLINICAL PATHOLOGY

E.K. Harris, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Div. of Computer Research & Technology, Laboratory of Applied Studies, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 CT 00007-12 LAS)

Univariate and multivariate time series models are being applied to various databases consisting of short series of measurements of serum biochemistries in healthy subjects. The purpose is to gain practical experience in the use of these statistical forecasting techniques for detecting real changes and trends within subjects, taking into account random biological variation and measurement error. The time scale of these series varies from weekly to 6-month and 12-month intervals between observations. Parallel computer-based simulation studies of these models are also underway, particularly to estimate the relative sensitivities and specificities of multivariate and univariate forecasting methods. Mathematical investigations into the asymptotic properties of a new stochastic model of linear change have begun, and this model is being applied to data from patients at the Clinical Center under long-term therapy.

BIOMEDICAL RESEARCH SUPPORT GRANT

A.D. Frame, Inter American University of Puerto Rico, Aguadilla Campus, Undergraduate School, Dept. of Natural Sciences, *Aguadilla, Puerto Rico* 00603 (S06 RR 08159-03)

The goals of the Biomedical Research Program at Inter American University is to determine the status of Fasciola hepatica in both cattle and man on the Island and to control (or eradicate) the progress of the disease through the various investigations functioning within the MBS program.

The proposed investigations are the following: 1) to deterine the prevalence of F.hepatica in a segment of the populations of cattle and man in Puerto Rico by means of fecal sampling using a sedimentation method for cattle and a concentration technique for the analysis of the human feces. 2) to study epidemiological factors and the snail intermediate host, Lymnaea cubensis, on the farms and river areas in order to better understand the cycle of the parasite and the progress of this disease. 3) to develop a more effective means for diagnosing fascioliasis in cattle using immunodiagnostic methods for detecting F.hepatica antibodies. 4) to control the snail intermediate host for R.hepatica, the L.cubensis, by using natural products extracted from plants common in Puerto Rico. 5) to determine the effect of F.hepatica on the quality of milk produced by the diseased cow.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Div. of Research Resources $107,260

BIOMEDICAL SCIENCES

J.K. McNeley, Navajo Community College, Undergraduate School, Dept. of Social Sciences, *Tsaile, Arizona* 86556 (S06 RR 08163-02)

The program involves Navajo Community College students in research on significant health problems among the Navajo population. The Navajo Drinking Behavior project, having arrived at a cultural definition of alcohol abuse through the use of ethnoscience ethnographic procedures, will investigate the incidence of alcohol abuse of a sample of the Navajo population through the use of social survey research techniques. Clinical applications of research findings will also be explored. The Gastroenteritis project is investigating the incidence of diarrhea among newborn lambs and young children on the Navajo reservation with the objectives of identifying the agent(s) causing diarrhea within the two target populations as well as the environmental factors contributing to diarrhea. The Streptococcal Diseases project is engaging students in the isolation of beta-hemolytic streptococci from clinical sources and identification through presumptive grouping of A strain by bacitracin sensitivity and B strain by the cAMP test and hippurate hydrolysis followed by verification of presumptive grouping results by the fluorescent anti-body technique.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Div. of Research Resources $128,900

3.0515,

GENERAL CLINICAL RESEARCH CENTER

S.M. Mellinkoff, University of California, Los Angeles Campus, School of Medicine, Dept. of Medicine, *2025 Zonal Ave., Los Angeles, California* 90024 (M01 RR 00865-07)

The Clinical Research Center, funded by the National Institutes of Health, provides eight research beds for projects approved through the Human Subject Protection Committee and the CRC Advisory Committee.

There is no departmental restriction on the areas of research. Active investigation is being pursued by members of the Departments of Internal Medicine, Pediatrics, Microbiology and Immunology, Obstetrics-Gynecology, Pharmacology, Radiological Sciences,

Surgery, Ophthalmology, and Psychiatry. Any valid research program is carefully evaluated and all possible support is offered to the investigators. There are presently 35 active inpatient protocols and 22 active outpatient protocols, a total of 57.
SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Div. of Research Resources $749,811

3.0516,
GENERAL CLINICAL RESEARCH CENTER
F.H. Epstein, Beth Israel Hospital, Dept. of Medicine, *330 Brookline Ave., Boston, Massachusetts* 02215 (M01 RR 01032-05)
This proposal requests continued support for the General Clinical Research Center at the Beth Israel Hospital. The past three years have witnessed a broadening of the activities and accomplishments of the inpatient, outpatient and core laboratory components of the center, which continues to serve as the major focus of clinical research at Beth Israel. The present research program is multidisciplinary, including clinical studies in endocrinology, hematology, nephrology, diabetes and metabolism, cardiology, behavioral medicine, neurology, urology, general surgery, radiology, obstetrics, gynecology, computer medicine, gerontology, rheumatology, infectious diseases, dermatology and biostatistics.

3.0517,
GENERAL CLINICAL RESEARCH CENTER
T.E. Gaffney, Medical University of South Carolina, School of Medicine, Dept. of Pharmacology, *80 Barre St., Charleston, South Carolina* 29401 (M01 RR 01070-03S1)
This application for a Clinical Associate Physician to be associated with the GCRC at the Medical University of South Carolina requests support for Dr. Timothy Fagan. Dr. Fagan would assume this position following completion of two years of clinical research fellowship based entirely on work done in our GCRC studying the mechanism of action, disposition and pharmacokinetics of propranolol and applications of non-invasive technology to studies of the effects of drugs on ventricular function. Dr. Fagan has begun to develop the Non-Invasive Research Laboratory, separate from the clinical non-invasive laboratory based on cardiology, as a Core Research Resource for numerous studies that are underway on the GCRC. As a Clinical Associate Physician, Dr. Fagan will serve as a resource to a substantial number of senior investigators whose work in clinical cardiovascular pharmacology is already underway on the unit. Dr. Fagan's proposed research is described in detail in the application, was designed as a framework for Dr. Fagan's further professional development as an independent clinical investigator, and as a means to maximize the impact of the Clinical Associate Physician position on the further development of clinical research in the GCRC. The Clinical Associate Physician will be responsible to the Program Director for his general duties on the GCRC and to a single group of senior investigators, headed by the Principal Investigator, who will provide the primary direction for his research; he will also assist in the area of research headed by the Program Director.
SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Div. of Research Resources $18,332

3.0518,
GENERAL CLINICAL RESARCH CENTER - DENTAL MEDICINE
D.W. Cohen, University of Pennsylvania, School of Dental Medicine, Dept. of Periodontics, *4001 Spruce St., Philadelphia, Pennsylvania* 19104 (M01 RR 01224-02)
This application requests one year continuation support for a General Clinical Research Center at the School of Dental Medicine of the University of Pennsylvania to provide a multidisciplinary outpatient research center for the study of the applications of oral science to human needs. The center will provide a controlled environment with carefully selected and maintained groups for cross-disciplinary human study research in order to translate basic research findings into improved oral health and patient care and increased understanding of functions within the oral cavity. To achieve this goal, a multidisciplinary consortium of experienced investigators will apply microbiological, physiological, behavioral, and scientifically sound assessment methods to the study of oral processes, diseases and their treatment and prevention.

C U P R, BIOMEDICAL RESEARCH PROGRAM
G.A. Infante, Universidad Catolica de Puerto Rico, School of Science, Dept. of Chemistry, *Avenida las Americas, Ponce, Puerto Rico* 00731 (S06 RR 08067-10)
This program is a combination of nine projects. The first one proposes to investigate the inhibitory activity of alkaloids such as nitidine, fagaronine and related compounds. A second project involves the determination of atmospheric particulate and other gaseous pollutants and its relation to public health. Chemical and biological analysis will be carried out.
The third project deals with the radiation chemistry of biologically important compounds and radiosensitization and radioprotection studies in modern systems and also in vivo systems.
The fourth project involves the organization of the teleostian thalamus and telencephalum invertebrates. The project will also study different pathways from the Retina optictectum visual thalamus and telencephalum. Other project involves the analysis of estrogen receptor sites within cancerous tissues, including preservation, purity monitoring, morphological and biochemical studies.
The sixth project involves investigation on the lipid metabolism and morphology of torulopsis fujisanensis. Another project involves the isolation and characterization of N. Fowleri in Puerto Rico.
The eighth project involves the elucidation of the mechanisms of action of nitrofurans.
The last project involves investigation about identification, isolation and purification of dengue virus type 2 antigen for the induction of neutralizing antibody.

GENERAL CLINICAL RESEARCH CENTER
R.S. Ross, Johns Hopkins University, School of Medicine, Dept. of Medicine, *725 N. Wolfe St., Baltimore, Maryland* 21205 (M01 RR 00722-08)
Partial support is proposed for a special facility for ambulatory clinical investigation through The Johns Hopkins Out-Patient Clinical Research Center. Based on a 25-year previous experience of long-term outpatient investigation in a large number of disorders, the Center will provide facilities and financing for continual studies in acute and chronic medical and surgical illnesses of potential significance, the natures of which preclude in-patient investigation and for which clinical research can be most effectively and economically conducted on ambulatory subjects. Patients of all age groups will be included. Areas of major investigational emphasis include: nutritional management of chronic renal failure; evaluation of frequency and duration of hemodialysis in management of end-stage renal disease; long-term effects of persistent hepatitis B and other DNA virus infections in immunosuppressed renal transplant recipients; cryoglobulinemia and glomerulonephritis relationships; hypertension in diabetes mellitus and its association with diabetic retinopathy; the relationship of histocompatibility surface antigens to occurrence or modification of rheumatic disorders, polycystic kidney disease, hepatitis B infections, and renal vascular disorders, polycystic kidney disease, hepatitis B infections, and renal vasular disorders; controlled evaluation of corticosteroid therapy of pulmonary sarcoidosis; hormonal and other biologic aspects of medullary thyroid carcinoma and related endocrine neoplasms; familial studies in colorectal cancer; management of Marfan's syndrome and other genetic disorders, including skeletal dysplasias and dysmorphologies; prognostic implications of findings in arteriography and left ventriculography in survivors of acute myocardial infarction; relationship of colonic cancer to ulcerative colitis; and long-term effects of prolonged estrogen therapy for ovarian dysgenesis. Special attention will be given to epidemiologic, biomathematical, and hereditary aspects of these disorders.

COMPUTER RESOURCE FOR BIOMOLECULAR RESEARCH
J. Kraut, University of California, San Diego Campus, Graduate School, Dept. of Chemistry, *P.O. Box 109, La Jolla, California* 92037 (P41 RR 00757-08)
The objective of the Computer Resource is to aid the investigation of the structure, dynamics and function of biomolecules by providing a unified, powerful and highly interactive computer system for the collection, processing, storage, analysis and display of biomolecular data and for the construction, analysis and evaluation of models of biomolecular phenomena. Major areas of biomedical research of the Resource include: protein crystallography; relationships between structure and biological function for peptides and proteins; structural studies of polynucleotides; large system molecular dynamics and electropherogram analysis of proteins.

GENERAL CLINICAL RESEARCH CENTER
D.M. Kipnis, Washington University, School of Medicine, Dept. of Internal Medicine, *660 S. Euclid Ave., St. Louis, Missouri* 63110 (M01 RR 00036-20)
The Washington University General Clinical Research Center, established in 1960, consists of inpatient and outpatient facilities located in Barnard and St. Louis Children's Hospitals in the Washington University Medical Center. The 25-bed Adult Unit is located in Barnard Hospital and the 8-bed Children's Unit is located in St. Louis Children's Hospital. These units function under a single administration and share dietary and core laboratory services; the nursing services are separate. Both units are designed so that acutely ill as well as ambulatory patients and normal volunteers can participate in clinical investigation. The GCRC provides a physical setting for inpatient and out-patient studies with experienced and skilled, research quality nursing and dietary services and facilities for specialized studies. The GCRC Core Laboratory provides both technical developmental and specialized service support to GCRC investigators and patients. The service support provides determination which are not otherwise available or, in some instances, which would be available only at inordinate cost. All faculty members of Washington University School of Medicine who wish to pursue clinical investigation, and have research protocols approved by the Washington University Human Studies and GCRC Advisory committees, may use the resources of the GCRC. Although the primary function of the GCRC is clinical investigation, it also provides opportunities for undergraduate and post-graduate training in clinical investigation.

GENERAL CLINICAL RESEARCH CENTER
A.P. Richardson, Emory University, School of Medicine, Dept. of Medicine, *1364 Clifton Rd. N.E., Atlanta, Georgia* 30322 (M01 RR 00039-20)
This grant supports a facility where investigators from all departments of Emory University School of Medicine can study unsolved clinical problems under conditions of controlled diet and physical activity, and where most physiological and chemical variables can be monitored continuously for unlimited periods of time. Problems under study during the current

year are as follows: 1. Hematology-Oncology: Hemostasis; chemotherapy of leukemia; mechanism of proteinuria in patients with neoplastic disease; protein-calorie undernutrition in cancer. 2. Cardiology: Cardiomyopathy in muscular dystrophy; effects of protein-calorie mainutrition on the heart; hypertrophic cardiomyopathy. 3. Nutrition: Prevalence, causes and treatment of protein-calorie undernutrition. 4. Neurology: Therapy of multiple sclerosis; endocrine changes in Parkinson's disease. 5. Endocrinology: Juvenile osteoporosis; diabetes insipidus; growth hormone deficiency; subclinical muscular dystrophy; Turner's syndrome; cause of growth retardation. 6. Liver Disease: Hepatorenal syndrome; gastroesophageal varices; treatment of alcoholic hepatitis; surgery for portal hypertension and intractable ascites; disorders of amino acid metabolism in cirrhosis. 7. Gastroenterology: Effects of Mg deficiency. 8. Nephrology: Mechanism of nephrolithiasis.

GENERAL CLINICAL RESEARCH CENTER

L.E. Earley, University of Pennsylvania, School of Medicine, Dept. of Medicine, *36th & Hamilton Walk, Philadelphia, Pennsylvania* 19174 (M01 RR 00040-20)

This is an application for a five-year renewal of a General Clinical Research Center at the Hospital of the University of Pennsylvania. This Clinical Research Center is utilized for both in-patient and out-patient studies by members of the Departments of Pediatrics, Neurology, Medicine, Surgery, Radiology, Dermatology, and Obstetrics and Gynecology. Research protocols deal with a wide spectrum of diseases, mostly of a metabolic nature, which require specialized facilities for patient observation as well as dietary control. An associated clinical laboratory provides certain analyses which are required specifically by study patients and which are not otherwise generally available in the institution.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Div. of Research Resources $726,419

GENERAL CLINICAL RESEARCH CENTER

F.E. Young, University of Rochester, School of Medicine & Dentistry, Dept. of Microbiology/Pathology, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (M01 RR 00044-20)

Application is made for the renewal of funding for a General Clinical Research Center. The program of research activities involves the Departments of Medicine, Pediatrics, Radiation Biology and Biophysics, Psychiatry, Pharmacology and Toxicology, Obstetrics and Gynecology, and Surgery. Areas of special research interest include: neuroendocrine control of adenohypophysical function, of feeding and appetitive behavior, of glucose homeostasis, and of the hormonal determinants of blood pressure, metabolic alterations in neuromuscular disease and in cancer; the control of insulin secretion during fasting; caloric balance in children with acute and chronic illness; metabolic alterations in morbid obesity and the effects of bypass surgery; the relationship between temperature sensitivity and attenuated virulence of influenza A virus; salt, and trace metal metabolism in cirrhosis; the impact of clinical aerosols in airway mechanics and pulmonary gas exchange; plasmapheresis as a therapeutic modality in idiopathic thrombocytopenic purpura; disposition and turnover of isotopic mercury in industrial mercury workers; comprehensive assessment of metabolic, body compositional, hormonal, and electrocardiographic changes during protein-sparing modified fasts. Thus, the Center supports studies in Endocrinology and Metabolism, Nutrition, Neurology, Infectious Disease, Pulmonary Disease, Gastroenterology, Hematology, Toxicology, Psychiatry, Pharmacology, as well as Pediatrics and Obstetrics and Gynecology.

GENERAL CLINICAL RESEARCH CENTER

H.C. Knowles, University of Cincinnati, College of Medicine, Dept. of Internal Medicine, *Eden & Bethesda Aves., Cincinnati, Ohio* 45221 (M01 RR 00068-18S1)

Numerous studies have shown the etiology of Systemic Lupus Erythematosus (SLE) to be multifactorial though most investigations have shown an altered immune system to be the final pathway in expression of the autoimmune disease. Some lines of evidence have found a defect in cell mediated immunity and a specific defect of T-suppressor cells has been demonstrated. Familial studies, especially twin studies, have shown a high incidence of altered immune status in family members, an increased incidence of SLE among family members and a greater than 50% incidence of SLE among monozygotic twins. Other studies have suggested an environmental influence with the presence of lymphocytotoxic antibodies in SLE family members as well as close household contacts. If immunologic abnormalities can be demonstrated in SLE family members, specifically a suppressor T cell defect, this, in conjunction with the presence of anti-lymphocyte antibodies, would support the hypothesis that SLE manifests itself in those persons with a genetic predisposition given the appropriate environmental stimulus. It is the objective of this proposal to demonstrate such a defect.

The research plan will select 50 family members of SLE patients and a control group of 50 non-family close contacts matched for age, race, and sex. All subjects will be screened for serologic abnormalities seen in SLE and have delayed hypersensitivity skin tests performed. Lymphocytotoxic antibodies will be tested for in all groups and identification of any T cell function aberration. In the final phase of the study, those subjects in whom T cell abnormalities have been identified will have an in-depth study of T suppressor-helper cell defects.

GENERAL CLINICAL RESEARCH CENTER

W.B. Deal, State University System of Florida, University of Florida, School of Medicine, Dept. of Medicine, *1600 Archer Rd., Box J-266, Gainesville, Florida* 32610 (M01 RR 00082-18)

This proposal is for continuation of a seven-bed inpatient and outpatient CRC for children and adults at the Shands Teaching Hospital of the J. Hillis Miller Health Center of the University of Florida, to provide careful and optimal control of variables critical to clinical investigation in man. The Center is organized to provide a focus for communication and collaboration among health scientists advising on policy and carrying out studies in the unit, including specialists in: gastroenterology, pediatric and adult endocrinology, obstetrics and gynecology, metabolism, genetics, immunology, microbiology, oncology, pediatric and adult general surgery, urology, hematology, neurology, pathology, ophthalmology, psychiatry, psychology, biochemistry, pharmacology, nursing, pharmacy, pulmonology, and pediatric nephrology. Research-oriented nursing and dietary staff assist in the development of detailed and practicable protocols and assure adherence to them. The Program Director and Associate Director, assisted by the Advisory Committee, encourage and assist young investigators to develop clinical research proposals. A technician is responsible for dependable specimen handling and distribution and carries out assays of urine and blood constituents to assist investigators and save costs.

GENERAL CLINICAL RESEARCH CENTER

W.H. Luginbuhl, University of Vermont & State Agricultural College, School of Medicine, Dept. of Pathology, *85 S. Prospect St., Burlington, Vermont* 05401 (M01 RR 00109-17)

The Clinical Research Center at the University of Vermont consists of a six-bed research ward including a special diet kitchen, core laboratory and special procedure rooms which provide inpatient and limited outpatient facilities for the conduct of original investigation by members of the medical faculty. It is staffed by full-time nursing, dietary and laboratory personnel who are highly trained in patient care and research techniques. Thus, the Center provides an environment where suitable patients may be studied under optimum conditions for experimental control and accurate data collection.

Proposed research projects must be approved by the Committee on Human Experimentation for the Medical Sciences and are subjected to critical review by the Program Director and CRC Advisory Committee prior to final approval. They are rated on the basis of scientific merit, methodology, and appropriateness for human investigation. A priority rating is established for each research project and admission of patients to the Center is determined accordingly.

GENERAL CLINICAL RESEARCH CENTER - ADULT AND CHILDREN

A. Ebbert, Yale University, School of Medicine, Dept. of Internal Medicine, *333 Cedar St., New Haven, Connecticut* 06510 (M01 RR 00125-17)

The objective of this supplemental application is for the acquisition of a computerized data management system (CLINFO (TM) for the use of the clinical investigators using the Adult and Children's Clinical Research Centers at Yale University School of Medicine. Our Division of Research Resources-funded Clinical Research Centers have been actively functioning since 1963. Investigators from the Departments of Internal Medicine, Surgery, Psychiatry, Obstetrics and Gynecology and Human Genetics are currently conducting clinical research sponsored by the CRC. At the present time, no less than twelve investigators have ongoing studies for which they believe a computerized data management system would be extremely valuable.

We propose to locate terminals in the following seven strategic locations throughout the Yale University School of Medicine-Yale-New Haven Hospital complex: 1) systems manager's office on the GCRC; 2) GCRC core lab; 3) CCRC; 4) CCRC core lab; 5) endocrine section research lab; 6) renal section research lab and 7) Yale-New Haven Hospital clinical chemistry lab.

We believe that the acquisition of CLINFO for our CRCs will significantly improve the handling of data from the studies presented in the body of this proposal. In addition, we feel that CLINFO will be a valuable tool for training future investigators.
SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, Div. of Research Resources $1,207,410

GENERAL CLINICAL RESEARCH CENTER
F.C. Robbins, Case Western Reserve University, School of Medicine, Dept. of Medicine, *2109 Adelbert Rd., Cleveland, Ohio* 44106 (M01 RR 00210-16)
The Perinatal Clinical Research Center is a unique environment facilitating and supporting research programs involving pregnancy (mother and fetus), the neonate and the development of the infant. It is also an important education resource for the Medical School and Hospital and an avenue for attracting new recruits to this study area. The viability of this triple focused (mother, fetus and infant) and multidisciplinary Center is demonstrated by continuing research themes and the addition of many new programs.
Members of the Department of Obstetrics have introduced new studies in the areas of high risk pregnancy, antepartum bioelectronic monitoring of fetal heart rate, movements and respirations, the prediction of low birth weight infant outcomes and the effect on the fetus of environmental contaminants, including heavy metals, and drugs used during the antepartum and intrapartum periods. Studies in computerized data management and diagnosis, fetal electroencephalography and programmed identification of fetal distress are continuing. In the Department of Pediatrics, studies in fuel metabolism of the mother, fetus and neonate have been expanded and focused on diabetes mellitus and intrauterine growth retardation. Gas chromatography-mass spectrometry techniques are being used. Neonatal physiologic and pharmacologic studies have also been expanded, as have studies in infant neurobehavioral development, supported by the PCRC Developmental Assessment Unit. Additional areas of study include instrumentation, microprocessor applications, antenatal genetics, virology-immunology, infant perception and placental morphology.
The Center serves as a resource to the hospital, community and region for the dissemination of state-of-the-art clinical techniques for providing optimum care to the high risk mother, fetus and newborn. Finally, the Center, by virtue of its infant followup capabilities in the Developmental Assessment Unit has the important commitment to assist all of its investigators in the study of infant outcome, with respect to disease and treatment.

GENERAL CLINICAL RESEARCH CENTER
A. Dorfman, University of Chicago, Pritzker School of Medicine, Dept. of Pediatrics, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (M01 RR 00305-14)
The project is designed to operate a 4-bed Clinical Research Center for Children with facilities for multidisciplinary clinical investigations. The clinical studies will be supplemented by animal/basic research. Endocrine mechanisms that control normal and abnormal growth will be explored using new hormone assay methods. Refined methods for controlling diabetes and other metabolic disorders in childhood will be tested. Infants and children with cardiopulmonary problems will undergo examinations employing new methods for cardiac performance evaluation using non-invasive and quantitative angiocardiographic technics. Studies related to defining the basic biochemical defects in heritable connective tissue disorders will be continued, and attempts to correct some of these through enzyme replacement shall be made. A multidisciplinary study of the pathophysiology in gastrointestinal malabsorption syndrome in young subjects shall be made. New therapeutic programs for the correction of immune deficiency disease in children shall be tried. New drugs for the control of muscular dystrophy will also be tried. Other new therapeutic ventures will be directed towards the control of certain endocrine, neurologic, renal, cardiac, metabolic and hematologic disorders. Normal and abnormal behavior patterns in newborn infants will be evaluated.

BIONOMICS OF ANOPHELINE VECTORS OF MALARIA
A.E. Aziz, Ain Shams University, *Abbassia St., Cairo, Egypt* (03-062-N)
The completion of the Aswan High Dam and the filling of Lake Nasser have created a situation ideal for the introduction of Anopheles gambiae into Egypt from the Sudan. Owing to the extensive anopheline mosquito breeding places, the whole Egyptian population can be considered at risk to malaria.
Basic investigations will be performed on the capability of differing anopheline strains to act as vectors or carriers of the disease, as well as insecticide resistance, genetics, and determinants of vector range. The goal of the project will be the accumulation of sufficient knowledge of the bionomic, biology, and ecology of the proven and suspected anopheline vectors, so as to interpret factors affecting their control, and to establish a basis for sound planning, operation, and evaluation of control programs.
Malaria is still prevalent in Egypt and the potential for an epidemic is increasing. The absence in the past of definitive studies, as described above, indicate a real need for such baseline data in Egypt, and the objectives of the project, when completed, will provide the weapons necessary to combat any such outbreak.

TICK, VERTEBRATE & INFECTIOUS AGENT INTERRELATIONSHIPS
H. Hoogstraal, U.S. Dept. of Defense, Navy, Naval Medical Research Unit #3, *FPO, New York, New York* 09527 (03-036-N)
Results of this research will be collated and correlated with existing published and unpublished data to determine models of tick-pathogen-vertebrate interrelationships. The dynamics of these models will be analyzed to ascertain the combinations of factors that may impinge on human health and how these factors compare with those operating in cycles of pathogens transmitted to humans by fleas, lice, mosquitoes, and other hematophagous arthropods. Special experimental and field studies will be devoted to tick-virus-vertebrate interrelationship models.

MUTAGENIC/CARCINOGENIC AGENTS IN BODY FLUIDS OF CHILDREN
G.R. Warren, Montana State University, School of Letters & Sciences, Dept. of Chemistry, *Bozeman, Montana* 59715 (R01 CA 26647-02)
An isolated high lung cancer mortality area in Montana (Deer Lodge-Silver Bow County) has been studied in an effort to investigate the utility of rapid bioassays, such as microbial mutagenesis testing of urine samples, to predict impacts on a population by a possible carcinogenic environment. At one site (Anaconda-Deer Lodge County) the lung cancer was occupational while at another (Butte-Silver Bow County) all portions of the populations were equally at risk. Initial Ames testing of urine sample concentrates from school children in Butte, Montana showed elevated urine mutagen levels when compared with children from Anaconda. Simultaneously run air filter mutagen levels in Butte were higher as well. The present study will continue this investigation probing the relationship between air mutagen levels and urine mutagen levels in a group of school children over a monitored two week period as well as in-depth investigation of mobility and eating and drinking during the test period. The school children are selected by one day pre-screening in the school system. Due to the presence of metal mining and smelting as the major industry in this area the study concentrates on detecting metal mutagens as well as organics.

PROSTATIC CARCINOMA IN AMERICAN BLACKS
J. Kovi, Howard University, School of Medicine, Dept. of Pathology, *2400 6th St. N.W., Washington, District of Columbia* 20059 (R26 CA 26679-02)
The purposes of this study are: (A) to examine the association of carcinoma and morphologic manifestations of aging within the prostate gland in necropsies, and (B) to investiate by pretested questionnaires whether dietary and/or lifestyle habits of American blacks are related to the high incidence of prostatic carcinoma. The initial findings in our investigation are as follows. Prostate glands from 508 necropsy cases, 171 from Ibadan, Nigerian and 337 from Washington, D.C. were reviewed and analyzed for severity of arterial medial fibrosis, intimal thickening, muscle proliferation and the presence or ab-

sence of sclerotic atrophy of glands in the outer prostate. The vascular changes and the sclerotic atrophy of the glands were more severe in the U.S. specimens as compared to the African specimens (p less than 0.05). Sclerotic atrophy of glands in the outer prostatic area was more severe in prostates with microcarcinoma than in prostates without carcinoma (p less than 0.05). Twenty age-matched patients and controls have been analyzed for epidemiologic and nutritional variables so far. Associations between prostate cancer and the following epidemiologic variables were detected: 1. lower urinary tract infections 15 or more years before diagnosis of cancer (p less than 0.05), 2. exposure to irrigation, bougie and dilatation treatment of lower urinary tract infections (p less than 0.05), 3. family history of cancer (p less than 0.05) and 4. professional, paraprofessional and skilled occupation (p less than 0.01). In the nutritional study the following observations were made: The consumption of citrus fruits and juices was more common in controls than in prostate cancer patients (p less than 0.05). The consumption of butter milk was less common in controls as compared to prostatic carcinoma patients (p less than 0.05). Controls consumed more tabasco sauce than patients (p less than 0.05).

PATTERNS OF CARE IN ONCOLOGY

E.R. Greenberg, Dartmouth College, Dartmouth Medical School, Norris Cotton Cancer Center, *P.O. Box 833, Hanover, New Hampshire* 03755 (R18 CA 26690-02)

OBJECTIVES: This is a collaborative epidemiologic study of lung cancer patient care and survival in New Hampshire and Vermont. The study is designed to determine whether geographic variations in patient care in this rural area are related to the local availability of specialized cancer treatment facilities and whether this can account for geographic differences in survival. The study will allow us to examine one of the basic assumptions underlying cancer control programs, i.e., that identifiable populations in the U.S. lack easy access to sophisticated cancer treatment facilities and therefore receive sub-optimal care with resultant poor outcome.

APPROACH: The two-state population-based tumor registry has been used as a source of identified cases and we are conducting reviews of medical records to determine patient characteristics, functional status, tumor stage, and detailed treatment information. An independent slide review will provide information on histology. These data will be analyzed using univariate and multivariate methods to examine the effects of residence (i.e., distance from specialized treatment facilities) upon treatment received and length of survival. The analysis of survival times will necessitate adjustment for stage at diagnosis and other sources of bias.

POPULATION BASED STUDY OF LOWER URINARY TRACT TUMORS

L.D. Marrett, Yale University, School of Medicine, Dept. of Epidemiology & Public Health, *333 Cedar St., New Haven, Connecticut* 06510 (R26 CA 26692-02)

The general purpose of this study is to gain further knowledge about the etiologies of bladder tumor (BT) and other lower urinary tract tumors (LUTT), including tumors of the renal pelvis, ureter, and urethra. The study employs two types of epidemiologic data: 1) interview data on a wide range of possible risk factors; and 2) incidence and mortality data routinely collected by the Connecticut Tumor Registry (CTR).

As part of a large national collaborative study of BT, data about smoking (active and passive), occupational exposures, artificial sweetener and coffee consumption, hair dye use, quality of drinking water, and skin exposures to a variety of medicinal, chemical, and common household products were collected. Four hundred and fifteen (415) cases of BT diagnosed during 1978 and reported to the CTR, as well as a population sample of 880 controls, selected to have the same age and sex distribution as BT cases, have been interviewed.

We are currently extending this study 1) to include cases of LUTT diagnosed between 1/15/78 and 4/15/80 (We expect 100-110 such cases); and 2) to ask all LUTT cases as well as samples of BT cases and controls about their use of analgesics.

The CTR contains demographic and tumor-related data on all malignant neoplasms diagnosed in Connecticut residents since 1935. These will be utilized to examine trends in the incidence and mortality of BT and LUTT.

DIETHYLSTILBESTROL AND TESTICULAR CANCER IN CONNECTICUT

J.N. Lewis, State Dept. of Health Services, Preventable Diseases Division, *79 Elm St., Hartford, Connecticut* 06115 (R18 CA 27179-01)

This case-control study will determine the risk of males developing testicular cancer after exposure to diethylstilbestrol in utero. The case population will be drawn from the list of primary testicular cancers reported in Connecticut residents between 1945 and 1977. The cases studied will be those who were also born in Connecticut between 1945 and 1972. Two control groups, one drawn from birth certificates and the other from hospital populations, will be selected. Drug histories will be obtained from hospital records and from prenatal records of mothers. Other factors to be evaluated include exposure to other exogenous estrogens in utero, cryptorchidism, and hypoplastic testes.

LUNG CANCER ETIOLOGY IN NEW MEXICO'S HISPANICS AND ANGLOS

J.M. Samet, University of New Mexico, School of Medicine, Dept. of Medicine, *University Hill N.E., Albuquerque, New Mexico* 87131 (R01 CA 27187-01)

The New Mexico Tumor Registry (a population-based cancer registry participating in the SEER program) has identified marked differences in lung cancer incidence and mortality among New Mexico's multicultural population, with especially striking deficits of lung cancer occurring among Hispanic males. From the limited data currently available, cigarette smoking alone does not appear to explain their low risk status. Lung cancer rates for the state's Hispanic and Anglo females are similar and closely approximate national rates. These findings have been corroborated by investigators looking at Hispanic populations in California and Texas.

A population-based case-control study of lung cancer patients will assess the role of smoking, occupation, residence, and other putative etiologic factors. Time trends in the histologic types of lung cancer will be determined in a histopathology review of these cases, as will differences in the frequency of histologic types in the Hispanic and Anglo populations. Histology specific analyses will be conducted in the case-control study which may tighten exposure-histology correlations.

This proposed investigation should provide new information about the interactions of known risk factors and/or suggest the presence of previously unknown protective factors.

PROGRAM IN BIOMETRICS OF CANCER EPIDEMIOLOGY

I.D. Bross, Roswell Park Memorial Inst., *666 Elm St., Buffalo, New York* 14263 (R01 CA 27514-02)

The ultimate objective of this study is to assess the long-term iatrogenic effects of the various modalities of therapeutic intervention in breast cancer included in the first two collaborative clinical studies. Secondary objectives are further assessment of long-term therapeutic effects and benefit-to-cost assessments.

The goals for the current year are to assess the feasibility of various follow-up strategies that might be used in the eventual study and to produce preliminary information which, together with further information generated during the period of the continuation, could provide the basis for a renewal grant proposal that would make it possible to achieve the ultimate objectives of this study.

The specific significance of the proposed project is that it has reasonable prospect of answering important questions about the treatments of breast cancer which are currently of concern to both physicians and patients.

Since the study operates from a unique data base which was randomized with respect to treatment arms and this was also randomized with respect to long-term iatrogenic effects, the principal methodological problem in this study is to secure completeness of follow-up.

EPIDEMIOLOGY AND CANCER REGISTRIES IN THE PACIFIC BASIN

B.E. Henderson, University of Southern California, School of Medicine, Dept. of Community & Family Medicine, *2025 Zonal Avs., Los Angeles, California* 90033 (R13 CA 27751-01)

This proposal requests funds for travel and per diem for fifty (50) participants in the Third Symposium on Epidemiology and Cancer Registries in the Pacific Basin. The first and second symposia (1975 and 1978) provided a forum for the exchange of information on 1) the design and conduct of cancer registries, and 2) the status of research in cancer epidemiology in nineteen participating countries and territories of the Pacific. In addition, important collaborative research on several cancers (e.g., lung, breast, nasopharynx and liver) was developed.

The Third Symposium will be designed to provide new demographic information from existing cancer registries (e.g., secular trends, occupational risk) and to introduce data from developing registries in the People's Republic of China, Korea, and the South Pacific. In addition, ongoing collaborative research will be reviewed and new projects designed during workshops on cancer sites of particular interest - liver, breast, stomach, colo-rectal, lung, urinary bladder, and prostate and testis. Dr. Henderson will visit several of the participating programs prior to the Third Symposium to provide added stimulus to the meeting preparations.

TESTICULAR CANCER AND PRENATAL DES EXPOSURE

A.R. Moss, Northern California Cancer Program Inc., *770 Welch Rd., Suite 190, Palo Alto, California* 94304 (R01 CA 27752-01A1)

Testicular cancer is the most frequent solid tumor in young men, with incidence rates for the 20-30 year old group reaching 11 per 100,000 in high incidence regions such as the San Francisco Bay Area. Recent evidence, including one case-control study, has linked certain testicular cancers with prenatal exposure to diethylstilbestrol (DES), synthetic hormone given to several million women in the 1940's, 50's and 60's to prevent abortion. The purpose of the present proposal is to carry out a case-control study of testicular cancer and prenatal DES exposure in young men in Northern California.

Cases for the proposed study will be drawn from institutions participating in the Northern California Oncology Group, including Stanford University Hospital, the University of California at San Francisco, and Children's Hospital of San Francisco. It is proposed to interview 250 cases over a three-year period. Men participating in the study will be asked to provide access to their mothers and also to peer controls who share the cases' early life experiences. The mothers of both cases and controls will be interviewed to determine their exposure to DES during pregnancy. Positive reported exposure to DES will be verified by inspection of medical records for both case and control mothers. Negative exposure to DES will be verified in a twenty percent sample of mothers.

The study will be carried out by staff of the Northern California Cancer Program, the parent organization of the Northern California Oncology Group. Statistical consultation is available through the statistical

consultants of the Northern California Oncology Group.

STATISTICAL GENETIC ANALYSIS FOR CANCER FAMILIES

R.C. Elston, Louisiana State University, Medical Center, School of Medicine, Dept. of Biometry, *1542 Tulane Ave., New Orleans, Louisiana* 70112 (R01 CA 28198-01)

Appropriate statistical models will be developed for the analysis of family data to elucidate the action of major genes governing susceptibility to cancer and similar diseases with variable age of onset; these will include segregation and linkage models, that allow for familial environmental components, for both qualitative and quantitative traits. Computer programs based on these models will be written, documented for general use, and used in simulation experiments to assess the power, efficiency and robustness of the methods of analysis developed. These models and programs will also be used, collaboratively, in the analysis of cancer family data collected by other workers. This will result in the development of appropriate methods, based on the results obtained, for genetic counseling of individuals in cancer families; and for the early detection of cancer-prone individuals to help research in the biochemical pathways involved.

3.0551,
THE EPIDEMIOLOGY OF LEUKEMIA IN RURAL IOWA

K.J. Donham, University of Iowa, School of Medicine, Dept. of Preventive Medicine & Environmental Health, *Jessup Hall, Iowa City, Iowa* 52240 (R01 CA 28626-01)

Unlike most cancers, leukemias occur at elevated rates in rural and farm populations. Previous studies have been unsuccessful in identifying any specific risk factors for leukemia in rural areas or farming.
Using incidence data from the Iowa Cancer Registry, we have completed extensive preliminary ecologic-epidemiologic studies which have indicated there are elevated leukemia rates in Iowa which are strongly associated with: 1) male sex, 2) rural residence, 3) proximity to high cattle population densities, and 4) proximity to dairy herds with cases of bovine lymphosarcoma. The elevated rates and the associations noted were primarily associated with acute lymphoid leukemia (ALL). These preliminary data are suggestive that cattle and perhaps the bovine leukemia virus (BLV) may be factors in the high rates of leukemia seen, at least for ALL. We propose a case-control study to verify the ecologic relationships seen in the preliminary studies, and to investigate on an individual basis the role of various factors in the rural and agricultural environment that may contribute to the observed high leukemia rates.
Approximately 200 cases of ALL (male and female) will be drawn from the Iowa Cancer Registry for the 66 rural counties. Two normal controls for each case will be selected from the same counties, and the cases and controls will be matched for age, sex, and county of residence. Personal interviews of each case and control will be completed to obtain data on: 1) environmental or occupational exposure to cattle, 2) environmental or occupational exposure to bovine leukemia virus, 3) farm or non-farm occupation, and 4) various exposures within farming such as agricultural chemicals and other livestock species.
Dairy herds of cases and controls will be tested serologically to determine the extent of BLV infection. The data will be analyzed to discern a possible cause-effect relationship of exposure to cattle, BLV, and other factors in the rural/agricultural environment.

ROLE OF ALCOHOL AS PRIMARY RISK FACTOR IN ORAL CANCER

A. Mashberg, College of Medicine & Dentistry of New Jersey, New Jersey Medical School, School of Medicine, Dept. of Surgery, *100 Bergen St., Newark, New Jersey* 07103 (R01 CA 29214-01)

The objective of this case-control study is to determine the significance of alcohol in the development of oral and pharyngeal squamous carcinoma and its relative risk compared to that of cigarettes. Our preliminary studies appear to indicate that alcohol may be a greater risk factor than tobacco and that beer and wine in particular appear to be significantly greater risk factors than whiskey. Patients admitted or identified as having squamous carcimoma of the oral cavity or pharynx will be entered into the study as cases. A history of alcohol comsumption, smoking habits, other upper aerodigestive tract cancers and other epidemiologic data shall be gathered for these patients via interview at the time of diagnosis. A control population without history or evidence or oral, pharyngeal or upper aerodigestive tract cancer (lung, larynx, esophagus) will be selected from the hospital population and interviewed in the same manner. Statistical analysis of data will be made with particular attention paid to the role of alcohol and tobacco, used either jointly or separately; individual analysis of beer, wine and whiskey will be included.

3.0554,
HEREDITY AND ENVIRONMENT IN CHILDHOOD CANCER

A.T. Meadows, Childrens Hospital of Philadelphia, *3400 Civic Ctr. Blvd., Philadelphia, Pennsylvania* 19104 (R01 CA 29275-01)

Although cancer is the leading cause of morbidity and mortality in children beyond infancy, etiologic factors are not known, except in few cases. Clues from epidemiologic studies in adults and from animal data suggest that substances which could produce germinal mutations may also act to produce malignant transformation in somatic cells.
We propose to investigate possible etiologic factors in childhood cancer, which could explain the uniform incidences of some cancers around the world (spontaneous fraction), the preponderance of multicentric or bilateral cases in some instances (germinal mutations), and the environmental factors causing both somatic and germinal mutations. By identifying individuals at high risk of childhood cancer we may be able to devise methods of prevention.
The methods used will involve: (1) The Greater Delaware Valley Pediatric Tumor Registry (GDVPTR), a population based registry, in order to monitor the incidence of childhood cancer in a 31-county region and to determine tumor-specific incidence rates especially comparing the incidence of multicentric cases with expectations. (2) A case-control study to test hypotheses concerning important risk factors in the etiology of childhood cancer. This would include approximately 650 children with various malignant diseases and 1300 controls to investigate pre-natal, gestational, and post-natal exposures such as those known to be mutagens or carcinogens in animal systems and adults.

3.0555,
A CASE CONTROL STUDY OF HODGKIN'S DISEASE

S. Davis, Fred Hutchinson Cancer Research Center, *1124 Columbia St., Seattle, Washington* 98104 (R23 CA 29395-01)

The present research is designed to determine whether or not cases of Hodgkin's Disease (HD) aggregate through prior interpersonal contact prior to their disease manifestation more than would be expected to occur by chance in comparable persons without the disease and, if so, whether such 'exposure-clustering' is confined to young persons under age 40. Although epidemiologic and clinical findings suggest that HD may be the result of two etiologic processes, that in the young perhaps being of an infectious origin, no adequate demonstration of space-time aggregations of HD cases has yet been observed. Similarly, several specific factors which bear on the hypothesis of an infectious etiology have not yet been evaluated and the effects of additional purported risk factors are not well understood.
This study employs a matched-pair case-control design, which is a new approach in searching for aggregations of HD cases through prior contact and assessing the significance of those contacts found. It also provides the opportunity to more fully assess several potential factors of risk for the disease. Approximately 250 cases of HD are to be identified in three Western Washington counties using a population-based cancer registration system, and one control is chosen for each case of the same sex and approximate age from the case's neighborhood of residence at the time of his/her diagnosis.
Data collected through personal interviews will be analyzed using newly-developed techniques to look for excessive prior contact among cases. In addition, evaluations will be made of the following factors, many of which may bear on an infectious model of disease: 1) childhood social class, birth order, family size and common infections; 2) exposures to drugs, especially amphetamines and narcotics; 3) exposure to sick domestic animals; 4) exposure to phytohemagglutinin (PHA); 5) prior surgery, especially tonsillectomy and appendectomy; 6) prior infectious mononucleosis; 7) seasonality of date of first symptom; and 8) occupational exposure to wood or wood products.

CANCER IN WOMEN RECEIVING EXOGENOUS ESTROGENS

M.F. Arnold, University of Denver, Denver Research Inst., *University Park, Denver, Colorado* 80210 (R18 CA 29543-01)

The issue of replacement estrogen for post-menopausal women has created a variety of controversies in terms of potential benefits and potential risks. This project is concerned primarily with the prevention of estrogen-dependent neoplasia (breast or endometrium). In view of the extensive literature on both the potentially beneficial effects of estrogen treatment and the potentially detrimental effects, there is likely to be disagreement in the professional community and confusion and concern among the patient population and the public.
The plan for the project is to enlist the cooperation of a selected group of physicians to participate in the demonstration by: (a) Following recommended policies for surveillance, diagnosis and treatment, and follow-up for patients for whom they are prescribing estrogenic hormone therapy; and (b) providing data, or access to data collections, regarding therapeutic regimes for their patients on hormones and special information on those patients showing symptoms or signs such as bleeding or mammary masses. Recommended policies for surveillance, diagnosis and treatment, and follow-up of patients will be developed by a Medical Steering Committee sponsored jointly by the Denver Medical Society, the Colorado Division of the American Cancer Society and the CRCC. Participating physicians will be provided consultation on surveillance, diagnosis and treatment of both endometrial and breast cancer as well as consultation for patient education.
A supporting and reinforcing community education program will be directed at women over forty-five.

EPIDEMIOLOGY AND ETIOLOGY OF HUMAN BREAST CANCER

N.K. Day, Sloan Kettering Inst. for Cancer Research, Biology Laboratory, *410 E. 68th St., New York, New York* 10021 (R01 CA 29711-01)

We have evidence using two methods developed in our laboratory that sera of breast cancer patients have cross-reacting antibodies to mouse mammary tumor virus (MuMTV). The antibody levels are reduced by more than 80% following absorption with

MuMTV, the membrane protein of the virus gp52, and also in preliminary experiments, by deglycosylated virus, indicating that the antibody is not a heterophile. Further, the antibody is not absorbable by erythrocytes from equine, human, sheep, bovine and pig, fetal calf serum and by two murine leukemia viruses (AKR and Rauscher). Studies from a geographical perspective show that 66% of women with breast cancer from E. Africa, 26% from U.S. and 31% of E. Indian women have this antibody in their sera. In contrast, only 5% of Chinese women with breast cancer have this antibody. Studies of families with a high propensity for breast cancer showed that family members including some male members also have this antibody. We have also demonstrated that breast cyst fluids (BCF) have an IgA antibody with reactivity to MuMTV. We plan to investigate the specificity of this antibody present in serum of some breast cancer patients using exhaustive and extensive absorptions and inhibition assays. We will also search for the antigen(s) to the MuMTV free in the circulation and in circulating immune complexes (CICs) in sera of patients with breast cancer using monospecific antisera against MuMTV, gp52, monoclonal antibodies, deglycosylated MuMTV. We will search for free antibody in serum and in CICs using purified MuMTV and all defined components of MuMTV. We will apply these reagents to study the relationship of the antibody in sera of breast cancer patients and the presence of antigens recognized by antibodies to the MuMTV in breast tissue from the same patients, and to study particles present in breast cyst fluid and breast nipple expression. Preliminary data in our laboratory show that high levels of CICs correlate with low levels of MuMTV-reactive antibody and complement. Following mastectomy, the CIC levels drop, antibody and complement levels increase. These studies, using new methodologies and new materials (BCF), will allow for a clearer definintion of the relationship between MuMTV and human breast cancer.

3.0558,
CONFERENCE ON BIOSTATISTICS IN CLINICAL ONCOLOGY

V. Mike, Sloan Kettering Inst. for Cancer Research, *410 E. 68th St., New York, New York* 10021 (R13 CA 29801-01)

The objective of this grant proposal is to obtain funding for a one-week conference on biostatistics in clinical oncology, to be held in June 1981 at Memorial Sloan Kettering Cancer Center in New York City. Plans for this conference are a direct result of recommendations made by the Workshop on Epidemiology and Biostatistics in Clinical Cancer Education sponsored by the National Cancer Institute in March 1979. Since there are not enough professionals trained in biostatistics to meet the needs of medical schools and cancer centers around the country, special conferences would be most desirable to enhance the effectiveness of individuals now filling many of these positions. The Chairman of the Biometrics Section of the American Statistical Association asked the Principal Investigator to serve as Chairman of a new committee created to organize such a conference; the Co-investigators were appointed committee members.

The proposed conference is designed for statisticians and others with a general background in statistics who are currently involved in some aspect of clinical cancer research, but are not part of an established biostatistics group and have not had specific training in this area. Lectures and panel discussions will cover a broad spectrum of topics, from questions of study design and modern statistical methodology to issues of medical ethics and various aspects of teaching and statistical consulting in the medical community.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $53,555

3.0559,
LYMPHOCYTE CARCINOGEN METABOLISM IN ACUTE LEUKEMIA

J.L. Blumer, Case Western Reserve University, School of Medicine, Dept. of Pediatrics/Pharmacology, *2109 Adelbert Rd., Cleveland, Ohio* 44106 (R23 CA 30067-01)

Acute leukemia ranks as the malignancy of highest incidence in the pediatric population of the United States. Despite the recent epidemiologic data which suggests that environmental carcinogens may be responsible for most of human cancer, chemical carcinogens are seldom considered as etiologic agents in pediatric neoplasms. The proposed research will examine the ontogenetic expression of aryl hydrocarbon hydroxylase, glutathione-S-transferase and epoxide hydrase in human lymphocytes and elucidate the patterns of expression of these enzyme activities in children with acute leukemia. This work should permit the recognition of developmental factors which affect the susceptibility of infants and children to the neoplastic effects of chemical carcinogens. It will also provide important insight with respect to the ability of the human fetus to interact with its chemical environment. Finally, the patterns of expression of these enzyme activities in acute leukemia will provide a basis for assessing the relative importance of ontogeny and genetics in the proposed association between chemical carcinogens and pediatric malignancy.

THE EPIDEMIOLOGY OF CHILDHOOD RHABDOMYOSARCOMA

S. Grufferman, Duke University, School of Medicine, Dept. of Pediatrics, *Box 3711, Durham, North Carolina* 27710 (R01 CA 21244-02S1)

An incidence survey of childhood rhabdomyosarcoma (RMS) has been conducted covering the State of North Carolina during the period 1967-1976. This was initiated by the clinical observation of a possible 'epidemic' of RMS in the state. Preliminary data suggest that rather than an epidemic, there has been a 'straight-line,' almost 4-fold increase in RMS incidence over the 10-year study period. The incidence rate reached is greater than previously reported estimates based on mortality statistics but the same as estimated incidence data from the Third National Cancer Survey. It also appears that males are affected more than females (M/F equals 1.7) and blacks more than whites (B/W equals 1.3). In previous studies the excess of males was less marked (M/F equals 1.0-1.4) and whites experienced higher risks than blacks. case-control approach is currently being used to study the 'descriptive epidemiology' of RMS as well as associations between RMS and potential antenatal, childhood, familial, dietary and environmental etiologic exposures.

STUDIES ON CANCER PATIENT DATA CONTROL

D.B. Fischer, Yale University, School of Medicine, Dept. of Epidemiology & Public Health, *333 Cedar St., New Haven, Connecticut* 06510 (R10 CA 21194-04)

The objectives of this proposal are: 1. To continue the Epi-Stat program for the development of a statistical base of information (tumor registry) on patients diagnosed and/or treated at the Yale Comprehensive Cancer Center which is compatible with the Centralized Cancer Patient Data System and which is a resource for clinical and epidemiological investigations in cancer. 2. To improve the quality control of data entered in this system. 3. To investigate areas where the data base may be expanded in order to increase the research potential of the tumor registry. 4. To develop and carry out through the Centralized Patient Data System, protocols for collaborative studies of cancer patient characteristics, and natural history, treatment and etiology of cancer.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $63,712

3.0562,
STUDIES ON CANCER PATIENT DATA CONTROL

R.L. Prentice, Fred Hutchinson Cancer Research Center, *1124 Columbia St., Seattle, Washington* 98104 (R10 CA 21193-04)

This proposal is to continue the creation and utilization of a patient database, on approximately 2400 patients per year, for the Fred Hutchinson Cancer Research Center. The patient population consists of in-house leukemia patients, patients enrolled in designated Oncology Units in six affiliated hospitals and cancer patients at Children's Orthopedic Hospital. Uniform data on all patients (the minimal data set), along with annual follow-up data, will continue to be pooled with that from other comprehensive cancer centers as part of the SAQC-CCPDS system. The minimal data will hopefully act as a springboard for collaborative research activities during this proposed project period. Data utilization objectives include the analysis of locally generated protocol studies, participation in and analysis of special studies on bone marrow transplant recipients, the production of interim accrual and survival reports to participating Oncology Units and the comparison of survival data on patients in the local SEER (Surveillance, Epidemiology and End Results) and CCPDS databases.

BIBLIOGRAPHIC REFERENCES: Prentice, R.L. (1978). Regression Analysis of Censored Survival Data with Extensions to Include Competing Risks and Case-Control Studies. The Evaluation of Environmental Biological Hazards and Competing Risks. (Ed. Peter Groer). In press.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $87,772

3.0563,
STUDIES ON CANCER PATIENT DATA CONTROL

A.K. Bahn, University of Pennsylvania, School of Medicine, Dept. of Research Medicine, *36th & Hamilton Walk, Philadelphia, Pennsylvania* 19174 (R10 CA 21183-04)

This is a three year study to expand and integrate the statistical database for the Fox Chase/University of Pennsylvania Comprehensive Cancer Center. The inclusion of outpatient tumor clinics in the database necessitates training of clinic personnel in CCPDS data management procedures and in the expenditure of funds to computerize and to interface these units with the existing database. The development of an integrated data system will increase the efficiency of both casefinding and patient followup.

Increased utilization of CCPDS database by both clinical and epidemiologic staff will be encouraged. Data will be valuable for identifying types of patient trends, treatment, pattern of patient residence, etc. Data quality control will continue to be a major portion of the research contract.

The responsibility to accomplish these objectives lies with the coordinated data management team at the FC/UPCC. The team is headed by the Data Coordinator, with the Director of Biostatistics, Systems Analyst and Associate Data Coordinator playing active roles. Support staff includes a keyin data clerk, research assistant and part-time programmer.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $122,837

3.0564,
DEVELOPMENT OF CENTRALIZED CANCER PATIENT DATA SYSTEM

J.R. Durant, University of Alabama in Birmingham, School of Medicine, Dept. of Medicine, *1919 7th Ave. S., Birmingham, Alabama* 35233 (R10 CA 21182-04)

The objectives of this proposal are to maintain and continue to develop patient entry points for the Cancer Center; to interact with new hospital and clinical facilities, to evaluate protocol patients, improve quality control and carefully plan and develop research modules and projects.

The CCPDS staff will continue to develop relationships with Cancer Center hospitals, clinics and physicians. Children's Hospital, for example, has recently been added to CCPDS. Protocols are now being recorded by CCPDS and in-depth site-specific registries have been developed for melanoma, head and neck cancer, uterine cancer, breast cancer and sarcoma.

The Cancer Center has recently strengthened Epidemiology and Biostatistics with the addition of an internationally known cancer epidemiologist as Associate Director of the Cancer Center. Special studies and modules are being planned and readied for consideration by the Technical and Policy Advisory Committees of CCPDS. CCPDS staff members are active on the data utilization, quality control and research planning subcommittees of TAC.

CLINICAL & PHARMACOLOGICAL ANTINEOPLASMS STUDY

P. Calabresi, Brown University, Roger Williams General Hospital, Dept. of of Medicine, *825 Chalkstone Ave., Box 1883, Providence, Rhode Island* 02908 (P01 CA 20892-05)

This is a broad coordinated program combining work in the fields of drug development, biochemical pharmacology, and cancer biology to generate new scientific information with direct and practical relevance for use in man. A significant feature of the proposed program is the collaborative interdisciplinary approach that will result in an efficient mechanism for translating basic scientific information through clinical investigators to practicing physicians, and provide an effective feedback from the clinic to the laboratory as well. A fundamental objective is to seek basic information that will contribute to clinical utilization in human cancer.

BIBLIOGRAPHIC REFERENCES: Calabresi, P., Dexter, D.L., and Heppner, G.H. Clinical and Pharmacological Implication of Cancer Cell Differentiation and Heterogeneity. Biochem. Pharmacol. 28: 1933-1941, 1979.

CHILDREN'S CANCER STUDY GROUP A

M.E. Lahey, Utah Higher Education System, University of Utah, School of Medicine, Dept. of Pediatrics, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (R10 CA 10198-13S1)

We propose to collaborate with other members of CCSG as well as with other members of other cooperative study groups, in research on leukemia, malignant solid tumors and closely related disorders in children. The chief purpose of the CCSG is to cooperate in several aspects of research in malignant disease in children (i.e., the natural history, epidemiology) and in particular to develop, evaluate and improve methods of diagnosis, prognosis and treatment of malignant disease in children.

Special emphasis will be placed on the study of new combinations and new schedules of already established chemotherapeutic agents as well as on the evaluation of new anti-cancer agents and new modalities of therapy.

The Principal Investigator is Chairman of the Histiocytosis Committee and has recently received approval by CIB of a new protocol designed to study this disorder in depth with particular attention to clinical and histologic features of prognostic significance, improved therapy and comprehensive immunologic evaluation. The prognostic significance of certain clinical features developed by CCSG has been tested and acclaimed by other chemotherapy groups.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $8,910

3.0567,

EPIDEMIOLOGIC STUDY OF OVARIAN CANCER

P. Greenwald, State Bureau of Cancer Control, Division of Epidemiology, *Empire State Plaza, Tower Bldg. Rm. 565, Albany, New York* 12237 (R01 CA 20502-04)

Our general objective is to determine, by means of a concurrent case-control study, whether risks of developing various histologic types of ovarian cancer are influenced by: a) Prior reproductive experience of the patient, b) cancer among first degree female relatives, c) a combination of these factors. The hypothesis that low fertility or infertility contribute to risk will be refined and assessed. Also, we will have a systematically derived and validated statement of familial risk among first degree female relatives. Additional study variables will include prior hormonal therapy, pre-existing medical conditions and menstrual history.

In the proposed study, two population controls will be selected for each ovarian cancer patient interviewed. The controls will be matched by age and county of residence. Demographic and clinical data will be collected from hospital records of each ovarian cancer patient, and pathology slides reviewed. Various types of epidemiologic data will be collected through face-to-face interviews with each patient and control. Standardized follow-up procedures have been developed for verifying whether or not the relatives have ever been diagnosed as having or have died from a malignancy.

CHILDHOOD BRAIN TUMOR CONSORTIUM

F.H. Gilles, Harvard University, Boston Campus, Childrens Hospital Medical Center, *300 Longwood Ave., Boston, Massachusetts* 02115 (R01 CA 20462-05)

A consortium of ten institutions located in North America has been organized, which utilizes the efforts of neuropathologists, pediatric pathologists, a neuroepidemiologist, neurosurgeons, and biostatisticians in a study of childhood brain tumors.

Our principal goal is to obtain accurate prognostic information for tumors at specific sites for the design of therapy for individual children, and for studies of competing therapies. The estimated data base from the ten institutions in the comsortium is between 3,000 and 3,400 children. We will use the first surgical sample for the assessment of the prognostic significance of individual histologic patterns and antecedent clinical features. We will use two classifications, that of the World Health Organization, and another one which uses the biologic characteristics of clustering of histologic patterns and life tables. We will choose which of these classifications provides the most accurate prognostic information for tumors at each site within the brain. This information will be entered into the computer via interactive programs which will provide: 1) specific prognostic information for tumors at each of several sites within the brain for individual patient care decisions by any pathologist or neurosurgeon, and 2) prognostic information for the design of studies of competing therapies.

BIBLIOGRAPHIC REFERENCES: Gilles, F.: Prognosis in cerebellar tumors. Lab. Invest. 40:4, 1979.

MULTIDISCIPLINARY APPROACH IN PANCREATIC CARCINOGENESIS

P.M. Pour, University of Nebraska, Medical Center, School of Medicine, Eppley Institute for Research in Cancer & Allied Diseases, *42nd & Dewey Aves., Omaha, Nebraska* 68105 (R26 CA 20198-04)

In seeking a renewal of our current grant, the following studies, based on our hamster model, are proposed. We will attempt to: (1) indicate the mechanism of pancreatic carcinogenesis through metabolic and alkylation studies (e.g., to ascertain the site and type of alkylation, the consistency of binding), as well as the rate and persistency of repair in target, and non-target tissue in the susceptible (hamster) and resistant (rat) species. In this context, the effect in the two species on pancreatic carcinogenesis of some modifying agents will be sought out. (2) We plan to determine modifying factors in pancreatic carcinogenesis by studying the effect of substances which influence the pancreas function by altering the blood supply and/or the physiologic response of pancreatic cells. (3) We will develop techniques for early detection of induced pancreatic cancer by radioimmunoassay. This study will concentrate on two areas: a) determination of circulating endogenous and exogenous hormones, such as insulin, glucagon, gastrin and glucose (including the tolerance test) during pancreatic carcinogenesis and b) Determination of the relationship between circulating levels of mucin (produced by cancer) and the extent during the tumor development. (4) We will conduct comparative morphologic-epidemiologic studies in human pancreas (random selection of autopsy material; surgical specimens of tissues after total pancreatectomy due to pancreas cancer) with 3 objectives: a) to determine the ultimate pancreatic cancer incidence by screening for occult and microscopic malignant lesions, b) to correlate human pancreatic lesions with those induced in our model and c) to correlate the histologic findings with clinical history with special emphasis on smoking and drinking habits, diabetes, liver and bile duct disease, etc. (5) Finally we will develop therapeutic methods (or induced pancreatic cancer) by using specific substances obtained by bound antibody (to tumor mucin) to specific and potent chemotherapeutic agents.

3.0571,

HOWARD UNIVERSITY CANCER CORE GRANT

J.E. White, Howard University, School of Medicine, Dept. of Oncology, *2400 6th St. N.W., Washington, District of Columbia* 20059 (P30 CA 14718-07A2)

The objective of this proposal is to secure continuing fiscal support of the Administration of the Howard University Cancer Center and the further growth of its Clinical and Basic Research Programs. The capabilities for more appropriate research have been enhanced by: 1. Acquisition of additional research space by an estimated 34,000 net square feet: 2. New Research Leadership; 3. Personnel changes - including removing non-productive scientists; 4. Focusing on a significant, relevant but more limited area of basic science, Molecular and Cell Biology, an area for which a nucleus of talent exists at Howard University Cancer Center but which will make significant and more rapid strides if senior investigators in this proposal are granted. It is nevertheless expected that the Center be given sufficient flexibility to evolve in directions appropriate to new thrusts of research in the scientific community.

3.0572,

CANCER CENTER SUPPORT GRANT--COMPREHENSIVE

A.A. Roman Franco, University of Puerto Rico, Medical Sciences Campus, School of Medicine, Dept. of Pathology, *P.O. Box 5067, Rio Piedras, Puerto Rico* 00936 (P30 CA 16598-05)

The Puerto Rico Cancer Center was awarded a Cancer Center Support Grant in June 1975. The Center has to date been quite successful in attending to the special needs of the Puerto Rican community. It has succeeded in promoting and establishing a broad based multidisciplinary program in cancer research and in cancer management. It has focused its attention on particular malignancies of high prevalence in the Island without neglecting the broader aspects of the cancer problem.

The objective now is to continue the development of the Cancer Center at the University of Puerto Rico Medical Sciences Campus, and to consolidate gains made in the past three years so as to continue strengthening our activities related to cancer in basic clinical research education and training, services, and community programs. A high priority item is to establish demonstration programs in cancer management using the latest findings of research and consonant with the special needs of the Puerto Rican community and sensitive to its cultural idiosyncracies. Another high priority is to provide high quality research through interdisciplinary interactions.

To this end the Puerto Rico Cancer Center has during the past year expanded its core laboratory resources, its clinical research resources, has established close operational links with all the major providers of health care in oncology, has bridged the differences between the 3 major volunteer organizations in oncology and has established an Island-wide network of educational activities that have enabled it to reach every corner of the Island. Furthermore, it has established links with the Oncologic Hospitals in Puerto Rico for the purpose of strengthening education, research and improving the facility of cancer care in Puerto Rico. The Puerto Rico Cancer Center

continues to be the source of cancer care policy for the Government of Puerto Rico.

CANCER EPIDEMIOLOGY - STATISTICAL METHODS

N. Mantel, George Washington University, Columbian College of Arts & Sciences, Dept. of Statistics, *2121 Eye St. N.W., Washington, District of Columbia* 20037 (R01 CA 15686-05S1)

The spontaneous occurrence of cancer in humans, or induced occurrence in laboratory animals, reflects the interplay of many variables. Also multivariate in nature are the factors influencing survival times or remission times of individuals with cancer, whether treated or left untreated. The multivariate statistical problems which arise may relate to identifying individually important variables which may be causative, making prognoses of survival or other predictions for cancer patients with a specified multivariate vector and seeking to identify optimal therapeutic procedures for such patients. Data available for such analyses may be prospective or retrospective in nature, and for the prospective case will generally involve incomplete observation. Recent developments in mathematical models and statistical approaches for relating response to multivariate regressors, specifically models involving hazard functions and generalized logistic regression, open the way to handling such problems, and it is the effective use of such models and approaches that I plan to study. In instances these approaches may bear modification as, say, using a classification approach when data are abundant but variables to be studied few in number. I anticipate that tie-ins with other problems of cancer epidemiology will develop. Related, or variant methods, may be appropriate in the study of potential environmental carcinogens. Methods for safety evaluation of such agents represent a preventive epidemiology approach.

THE CHILDREN'S CANCER STUDY GROUP

J.Z. Finklestein, University of California, Los Angeles Campus, Los Angeles County Harbor General Hospital, *1000 W. Carson St., Torrance, California* 90509 (R10 CA 14560-07S1)

OBJECTIVE: The purpose of this project is to continue and expand the active participation of Harbor General Hospital and affiliated institutions in all phases of the Children's Cancer Study Group.

The research involves a multi-disciplinarian approach to the clinical investigation of childhood cancer with special emphasis on chemotherapy of acute leukemia and solid tumors of childhood with collaborative protocols developed by the Children's Cancer Study Group. We will continue to participate in the study and the treatment of pediatric oncologic disorders by means of Phase I, II, and III Protocols. In addition, pertinent questions regarding natural history, treatment and epidemiology of childhood cancer will be investigated.

APPROACH: The results of therapies are recorded by the institutions' pediatric oncology staff, including Data Managers, and Protocol Nurse Coordinators, supervised by Subspecialists in Pediatric Oncology. Information is forwarded to the Operations Office for detailed statistical analysis.

The ultimate benefit is that the investigation involves controlled clinical trials in leukemia and solid tumors of childhood, controlled evaluations of newly developed therapeutic agents and controlled studies of the effects of immunotherapy and immunosuppression. Children participating in this project will benefit by being offered the most up-to-date methods of diagnosis, treatment and management of their disorders. The program seeks a scientific approach to a comprehensive, therapeutic investigation of childhood cancer.

CANCER CENTER SUPPORT GRANT

R.A. Good, Sloan Kettering Inst. for Cancer Research, *410 E. 68th St., New York, New York* 10021 (P30 CA 08748-15)

This application is for renewal of the core grant which has provided essential support for the research program of the Sloan-Kettering Institute for Cancer Research. This is a program of cancer research, many aspects of which are closely linked with the treatment activities of our sister organization, Memorial Hospital. The core grant has provided partial support of salaries of approximately 11% of the professional staff, including most of the Institute's scientific leadership, and has underwritten supporting resources such as animal maintenance services, biostatistical management, instrumentation, and other centralized activities required by a large productive scientific organization. An important provision has been the financial support necessary to develop new programs. The core support has been crucial in helping to assure stability and give a degree of flexibility not available to the Institute from University or State funds.

EPIDEMIOLOGY OF CANCER IN ADVENTISTS - A LOW RISK GROUP

R.L. Phillips, Loma Linda University, School of Health, Dept. of Biostatistics & Epidemiology, *Loma Linda, California* 92354 (R01 CA 14703-06)

Seventh-Day Adventists (SDAs) are a very much health-oriented religious group with a conservative lifestyle who do not smoke or drink by church proscription. For most of the cancer sites which are unrelated to smoking, the age-sex adjusted mortality among SDAs is 50-70% of the general population. For over 100 years, the SDA Church has strongly discouraged the use of coffee, other caffeine beverages, highly refined foods, and hot spices and has highly recommended a low-fat, high-fiber lacto-ovo-vegetarian diet, at the same time actively encouraging vigorous exercise and other health habits. However, with the exception of abstinence from smoking and drinking, there is great variation in the degree of adherence to these habits among SDAs, which makes them an ideal population for the investigation of the role of diet and other lifestyle characteristics in cancer risk. Furthermore, the great variation in duration of exposure and age at first exposure to the SDA lifestyle provides a unique opportunity to determine the relative effect of lifestyle patterns early vs. late in life, as well as the effect of short-term vs. long-term patterns of living. This ongoing prospective study seeks (1) to confirm with incidence data the previously observed low cancer mortality among SDAs and (2) to determine the specific components of the SDA lifestyle which account for their apparent low risk of non-smoking-related cancers.

Collection of baseline data on demographic characteristics from 61,258 California SDAs, as well as detailed lifestyle characteristics from 46,000 of these subjects, is virtually complete. Continuation of this study for 5 more years will provide an average 8.5 years of follow-up for the 61,258 subjects with completed questionnaire data (525,412 person-years). After adjusting for the expected low incidence, we expect to identify 2,481 new cancer cases (464 colon-rectal, 389 breast) by reviewing the hospital records of all hospitalizations which are reported during an annual contact with each subject. Comparison of site-specific cancer incidence among SDAs vs. the general population (as well as among subgroups of the SDA population with differing dietary and/or lifestyle characteristics) is likely to identify new lifestyle characteristics as cancer risk factors. (Text Abridged.)

CHILDREN'S CANCER STUDY GROUP

S. Piomelli, Columbia University, College of Physicians & Surgeons, Dept. of Pediatrics, *630 W. 168th St., New York, New York* 10032 (R10 CA 03526-24)

The Division of Pediatric Hematology of Babies' Hospital (the Pediatric Section of the College of Physicians and Surgeons of Columbia University) has participated in the research activities of Children's Cancer Study Group since 1957. Patients have been and will continue to be entered in the clinical trials of this Group, directed at devising optimal therapy for children's cancer and evaluating biological and natural history factors which are important; a multidisciplinary approach to cancer therapy will be followed, both at the institutional and at a national group level. Children with cancer cared for by members of the Division will be entered in the studies of the Group: they will receive medical care standardized to Group requirements, including all required laboratory and diagnostic investigations; accurate records will be kept and transmitted promptly to Group Headquarters for evaluation. Members of the Division will actively participate in the development of the research strategy of new studies. They will participate in the development of the Group scientific program, development and conduct of protocols for Ewing's sarcoma, retinoblastoma and non-Hodgkin's lymphoma, improved modalities for supportive care and definition of biological aspects of childhood cancer, refinement of Pediatric Surgical Oncology techniques and cost effective imaging techniques and coordination of the Group Pathology activities.

The Division of Pediatric Hematology/Oncology will coordinate the clinical care of childhood cancer in the Columbia Medical Community. Related research activities within the Division will be developed and eventually expanded to Group trials. These presently include studies of biochemical markers of malignancy; means to decrease toxicity of chemotherapy; the relationship between nutrition, cancer and chemotherapy; newly developed varicella vaccine and epidemiological aspects of perinatal cancer. The interaction between the clinical activities of the Division of Pediatric Hematology/Oncology and the comprehensive Cancer Center of Columbia University will be further developed.

CANCER CENTER SUPPORT GRANT

E. Frei, Sidney Farber Cancer Center Inc., *44 Binney St., Boston, Massachusetts* 02115 (P30 CA 06516-18)

To continue to serve as the major cancer center in the Harvard Medical School area and to play a leadership role in our region. To continue to develop and maintain clinical, laboratory and epidemiologic research programs of high quality related to cancer biology, prevention, diagnosis and treatment. To continue to provide a source of expertise in cancer diagnosis, treatment and supportive care. To continue to provide total care and rehabilitation on an interdisciplinary basis, in association with affiliating institutions. To continue to add to the total oncology resources of our medical community in terms of available staff, facilities and expertise. To continue to participate in teaching of medical students, house staff, fellows and graduate students and in the continuing education of practicing physicians and other health professionals. To continue to serve as a focal point for a regional cancer control program which is closely integrated with other activities of the Institute. To participate in regional clinical trials and in national clinical trials when appropriate.

CANCER EPIDEMIOLOGY AND PREVENTION RESEARCH CENTER

B. MacMahon, Harvard University, Boston Campus, School of Public Health, Dept. of Epidemiology, *55 Shattuck St., Boston, Massachusetts* 02115 (P01 CA 06373-18)

The proposed research is a program of studies of the epidemiology of the major human cancers, with the ultimate goal of developing knowledge which will lead to the prevention of these diseases.

The focus of the research will be on cancer of the breast, especially in relation to patterns of metabolism of endogenous estrogens in young adult life, oral contraceptive use, and other hormonal factors. Emphasis is on the detection of early markers characteristic of increased risk of cancer of the breast, prostate and colon. Other studies are on Hodgkin's disease, bladder cancer, cancer of the pancreas, and multiple myeloma. In addition, we plan to continue to develop epidemiologic methods, particularly

those methods for application in the field of cancer epidemiology. Methodologic areas of investigation include life table analysis of survival data and various aspects of significance testing and interval estimation.

Using a variety of resources, the studies will employ different epidemiologic approaches including case-control studies, prospective cohort studies, and review of existing data in the Department. Many of these studies are developed on the basis of studies designed and completed in earlier years; some studies are supported for planning phase only; and others are continuations of ongoing data collection and analysis.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $582,697

3.0580,
EXOGENOUS MATERNAL HORMONES AND CANCER IN DAUGHTERS

A.L. Herbst, University of Chicago, Pritzker School of Medicine, Dept. of Obstetrics & Gynecology, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (R01 CA 20084-05)

The Registry for Research on Hormonal Transplacental Carcinogenesis continues its investigation of the epidemiology, pathogenesis, biologic characteristics, management and prognosis of human genital cancers that develop after intrauterine exposure to exogenous sex hormones. A computerized data bank that contains carefully monitored and doubly checked details for each case forms the basis for this research. Active canvassing of treatment centers and tumor registries will continue in order to obtain all cases of clear cell adenocarcinoma of the genital tract occurring in females born since 1940, with or without a history of hormone exposure, as well as all cases of other types of genital cancer that develop in individuals exposed to either diethylstilbestrol (DES) or any other type of sex hormones including those of steroidal nature. Detailed clinicopathologic correlative studies will be directed toward wide variety of host and cancer characteristics that may be related to the behavior of the tumor (i.e., histology, depth of invasion, mitoses, grade and location). A particular interest exists in squamous cell carcinomas of the vagina and cervix that arise in the exposed. Knowledge of treatment and prognosis of these lesions will be expanded. Maternal history data regarding the age of the mother, the birth order of the daughter, as well as the pregnancy history of the mother will be investigated to determine their relation, if any, to the development of clear cell adenocarcinoma. We shall remain a source of scientific information and consultation for this problem.

PATHOLOGY - ELECTRON MICROSCOPY CORE FACILITY

W.B. Hutchinson, Fred Hutchinson Cancer Research Center, *1124 Columbia St., Seattle, Washington* 98104 (P30 CA 15704-07)

The electron microscopy laboratory is a basic core resource for many basic and clinical investigators at the Fred Hutcinson Cancer Research Center. It is supported by the CORE Grant (CA15704) for the Comprehensive Cancer Center comprising FHCRC. An AEI Corinth transmission electron microscope was installed in September 1975. A JEOL 100 electron microscope has been funded in the CORE Grant renewal of 1980 and installation is proceeding. Facilities are for all investigators of FHCRC. Major users have been Medical Oncology (in the diagnosis of tumors and research on the lesions of graft-versus-host disease), Genetics, Biochemical Oncology, Basic Tumor Biology, Tumor Immunology, and Developmental Biology. The new microscope will be used primarily by Genetics and Developmental Biology groups for studies of nuclear chromatin and DNA strands at high resolutions. Tumor Virology will also be using electron methods to characterize RNA viruses and their subunits.

COOPERATIVE CANCER CENTER CORE SUPPORT

W. Lawrence, Virginia Commonwealth University, Medical College of Virginia, Dept. of Surgery, *1200 E. Broad St., Richmond, Virginia* 23298 (P30 CA 16059-05)

The mission of the MCV/VCU Cancer Center is to coordinate the cancer research, patient-care services, oncology education and community outreach cancer programs at our institution. The center is organized with nine program areas, each with a coordinator. The research program areas include Cancer Cell Biology, Tumor Immunology, Pharmacology of Anti-Cancer Drugs, Carcinogenesis and Clinical Cancer Research. The non-research program areas include Cancer Training and Education, Clinical Cancer Services and Rehabilitation, Detection and Screening and Community Interaction. In addition, the Center has developed an Epi-Stat Unit, Tumor Registry, Cell Analysis and Sorting Lab, Tumor Immunobiology Lab, Media Preparation Lab, Histopathology Lab, Clinical Cancer Research Core and Evaluation components. In addition to these shared resources and program areas, the Core Support Grant provides some developmental funds for new projects and programs.

A PROGRAM IN MEDICAL ONCOLOGY

M.J. Cline, University of California, Los Angeles Campus, School of Medicine, Dept. of Medicine, *2025 Zonal Ave., Los Angeles, California* 90024 (P01 CA 15688-07)

The research programs in the Division of Hematology-Oncology will continue to encompass four program areas: 1) chemotherapy-immunotherapy of selected malignant diseases (acute leukemia, lymphoma, lung, breast, and head and neck cancer); 2) allogeneic and autologous bone marrow transplantation in combination with intensive chemoradiotherapy; 3) studies of normal and malignant hematopoiesis; 4) studies of host defense mechanisms against microorganisms and neoplastic cells.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $524,748

3.0585,
LAC-USC CANCER CENTER CORE SUPPORT GRANT

G.D. Hammond, University of Southern California, School of Medicine, Dept. of Pediatrics, *2025 Zonal Ave., Los Angeles, California* 90033 (P30 CA 14089-06S1)

This is a Cancer Center Core support grant providing Core support for administration, program, and research efforts for the Los Angeles County/University of Southern California Comprehensive Cancer Center. This Center is one of the nineteen designated comprehensive cancer centers in the United States.

Cancer activities at this Center constitute one of the largest University-based cancer research and control efforts in the nation. Principal effort is focused in a Basic Research Program including activity in Chemical Carcinogenesis, Tumor and Cell biology, Lymphocyte Biology, and Immunology; in Clinical Cancer Investigations including Tumor Imaging, Radiopharmacy, Hematopathology, Clinical Immunology, Clinical Pathology; Surgery, Chemotherapy, Immunotherapy, Phase II and III Trials, and Clinical Pharmacology; in Biostatistical and Epidemiological studies of major import; and in an extensive Cancer Control Program reaching throughout the southwestern United States. In addition, the Center conducts an extensive training and education program in the above specialty areas.

Nearly 150 faculty members and scientific investigators of the University and affiliated institutions are involved in this effort, with extramural funding for research, education, and control. The Center also acts as the Operations headquarters for the National Children's Cancer Study Group.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $0

3.0586,
CHILDREN'S CANCER RESEARCH CENTER

G.J. D'Angio, Childrens Hospital of Philadelphia, *3400 Civic Ctr. Blvd., Philadelphia, Pennsylvania* 19104 (P01 CA 14489-07A1)

The program of the Children's Cancer Research Center focuses on the special problems of pediatric oncology and seeks: 1) To devise better and more efficient treatments using clinical and laboratory studies so as to achieve best survival and lowest early and delayed complication rates. 2) To study and understand the late adversities of therapy so that they can be avoided or mitigated. 3) To identify causative factors with a view towards reducing the incidence of childhood cancer.

Integrated clinical, epidemiologic and laboratory investigations will be used to accomplish these objectives. Leukemia, neuroblastoma and other tumors and disease states of neural crest origin will be emphasized in clinical studies and those relating to the genetics, immunology, membrane biology, epidemiology and radiobiology of pediatric neoplasia. The development of minimal therapies for low risk patients and aggressive treatments, including those requiring bone marrow rescue for children at high risk, will be stressed.

The late effects of treatment will be studied, with special reference to the learning disabilities that follow cranial irradiation for leukemia and other cancers.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $749,159

3.0587,
COMPREHENSIVE CANCER CENTER FOR THE STATE OF FLORIDA

C.G. Zubrod, University of Miami, School of Medicine, Dept. of Oncology, *1400 N.W. 10th Ave., Box 520875, Coral Gables, Florida* 33152 (P30 CA 14395-08)

During the past year the Center has achieved great improvements in consolidation of its physical facilities; in the addition and growth of a number of laboratory research programs; and in rapid expansion of control programs throughout the entire state. The University has spent $1.2 million in renovation of the University's new quarters which will permit the move of all Center activities, except laboratory research, into a single building. Similarly the University is funding the move of our major laboratory research programs into a single research building. Programs in immunology and viral oncology have been added to the existing activities in cell kinetics, cell analysis, cell membranes, cell differentiation, epidemiology and carcinogenesis. The Center has been highly successful in working with health agencies throughout the state in obtaining legislation creating a statewide cancer registry and a Florida Cancer Plan for control. The Center, because of its excellent computer and biostatistics resources, was awarded the contract to run the state registry. Clinical care continues to place increasing demands upon physicians and this factor puts stresses upon clinical investigators.

3.0588,
SURVEILLANCE FOR DRUGS THAT MAY BE CARCINOGENIC

G.D. Friedman, Kaiser Foundation Research Inst., Dept. of Medical Methods Research, *1956 Webster St., Room 310 B, Oakland, California* 94612 (R01 CA 19939-05)

This epidemiologic study has two components. The first involves screening of commonly used medicinal drugs for possible carcinogenic effects. The drugs dispensed to 143,000 subscribers to the Kaiser Foundation Health Plan in the years 1969-1973 have been stored in computer records. These subjects are

followed up through Health Plan Records and subsequent incidence of cancer (each site and all sites) is determined for users of the drugs to be screened. The second component involves testing of hypotheses generated by the above screening analyses by detailed case-control studies involving the subjects' complete medical records.

BIBLIOGRAPHIC REFERENCES: Friedman, G.D.: Cancer after metronidazole (Letter to the editor with data). N. Engl. J. Med. 302:519, 1980. Friedman, G.D. and Ury, H.K.:: Initial screening for carcinogenicity of commonly used drugs. J. Nat. Cancer Inst. 65:723-733, 1980.

CANCER CENTER SUPPORT GRANT

J.W. Cole, Yale University, School of Medicine, *333 Cedar St., New Haven, Connecticut* 06510 (P30 CA 16359-05)

The Yale Comprehensive Cancer Center was recognized and funded by NCI on July 1, 1974. Dr. Joseph R. Bertino, Professor of Medicine and Head of Yale's Medical Oncology Unit was appointed as the Center's Director and served in this capacity during the 01 year. On July 1, 1975, Dr. Bertino accepted an ACS lifetime professorship and was replaced as Director of the Cancer Center by Dr. Jack W. Cole, Professor of Surgery and former chairman of the Department of Surgery at Yale. Dr. Cole is supported by two Associate Directors.

Dr. Sherman Weissman, Professor of Human Genetics, Medicine, and Molecular Biophysics and Biochemistry serves as Associate Director for Basic Science. Dr. J. R. Bertino of the American Cancer Society, Professor of Medicine and Chief, Section of Medical Oncology serves as Associate Director for Clinical Affairs.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $2,115,890

ENVIRONMENTAL CARCINOGENESIS

E.L. Wynder, American Health Foundation Inc., *320 E. 43rd St., New York, New York* 10017 (P01 CA 12376-08)

This program project grant has supported an integrated multidisciplinary program in environmental carcinogenesis relating retrospective case-control epidemiological studies and experimental research. The latter includes cell culture, animal model, and human subject investigations. Proposed studies by organizational division in the forthcoming period are: 1) Epidemiology: various cancer studies in the U.S. and overseas, emphasizing GI tract and breast cancer. 2) Nutrition: endocrine-related cancer studies via hormonal effects of high-fat diets in various human populations; also dietary studies on colon carcinogenesis utilizing fecal analyses. 3) Molecular Biology and Pharmacology: study of the mechanism of the high-fat effect on breast cancer development using animal models and cell cultures; also the mechanism by which alcohol may act as a cocarcinogen in oral cavity cancer. 4) Experimental Pathology: model systems for the study of the pathogenesis of tumor development. 5) Experimental Carcinogenesis: investigation of the carcinogenic action of hydrazines, nitrosamines, and methylated polynuclear hydrocarbons, in addition to bracken fern. 6) Occupational Health and Toxicology: assessment of cancer risk to welders as a model population.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $587,179

3.0591,
SOCIAL EPIDEMIOLOGY AND CONTROL OF CANCER

S. Graham, State University of New York, Health Science Center at Buffalo, School of Medicine, Depts. of Sociology/Social & Preventive Medicine, *3435 Main St., Buffalo, New York* 14214 (P01 CA 11535-11)

We request renewal of support of this program of research in Social Epidemiology and Control of Cancer. In the area of epidemiology, we would complete analyses on data already collected in the following areas: dietary vitamins, meats, fiber, cruciferous vegetables and other aspects of diet in cancer of the esophagus and larynx, to be studied in cases and controls from Roswell Park Memorial Institute (RPMI); reliability of diet interviewing, based on spouse interviews, diet diaries and 24-hour recall of diet in our Western New York Study; the interrelationships of herpes simplex virus 2, numbers of sex partners and other factors in cancer of the cervix in Los Angeles blacks and Chicanos; epidemiology of melanoma in 450 cases and 450 controls from RPMI. In addition, we wish to continue our ongoing data collection for the epidemiologic study of: cancer of the mouth, esophagus, stomach, larynx, colon, rectum, lung and bladder being carried out among all pathologically confirmed cases in Monroe, Niagara and Erie Counties and controls residing in the neighborhoods of cases; cancer of the testis and penis patients residing in New York State, as compared with controls residing in their neighborhoods; the interaction of oral contraceptives with other risk factors in the epidemiology of breast cancer; a prospective study of cancer among approximately 200,000 physicians and nurses in New York State, emphasizing diet. Throughout the period of study, we would carry on analyses of most of the above-named cancers for human genetics relationships.

Because many measures that can prevent or control cancer devolve from the epidemiology of those diseases and can involve changes in the human behavior, we are interested in the social and behavioral factors associated with cancer prevention and control. Thus, we wish to complete data collection in our study of the efficacy of breast self-examination (BSE) by comparing the proportion of breast cancer patients with advanced and early lesions who have practiced BSE. We also plan study of lower-middle, upper-middle and rural residents of Erie County, building upon our earlier inquiry on blacks, to ascertain their knowledge of cancer.

EASTERN COOPERATIVE ONCOLOGY GROUP

R.G. Hahn, Mayo Foundation, Dept. of Oncology, *200 1st St. S.W., Rochester, Minnesota* 55901 (R10 CA 13650-08)

The specific objective of this project is to participate in group activities aimed at improving the total care of cancer patients. This would include efforts to improve diagnostic procedures and therapy, and particular clinical pharmacologic studies on new cancer chemotherapeutic agents. Although emphasis would be placed on direct patient care, primarily conducted on an outpatient basis, we would also hope to participate in group activities pertinent to immunologic studies, epidemiologic studies, and the natural history and biologic patterns of specific neoplasms. This activity would be accomplished not only by the inclusion of Mayo Clinic patients in such studies, but also those of our satellite cancer control affiliates in North Central Cancer Treatment Group.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $373,873

3.0593,
EPIDEMIOLOGY AND NATURAL HISTORY OF BREAST CANCER

N.L. Petrakis, University of California, San Francisco Campus, School of Medicine, Dept. of Epidemiology & International Health, *551 Parnassus Ave., San Francisco, California* 94122 (P01 CA 13556-09)

The intent of this program-project grant is to investigate the epidemiology of breast cancer and benign breast disease. The work will include: the determination of epidemiologic characteristics of women diagnosed as having different histologically defined breast conditions; epidemiological and laboratory studies of the secretion of mutagenic substances into breast fluids, including their chemical characterization and potential DNA-damaging and repair activity on cells in human breast fluids and their metabolic activation by rat mammary tissue; epidemiologic investigations of estrogen-binding beta-globulin in blood and breast fluids; and research on the value and effects of breast cancer risk counseling.

3.0594,
RESEARCH IN ENVIRONMENTAL CANCER

N. Nelson, New York University, School of Medicine, Dept. of Environmental Medicine, *100 Washington Sq. E., New York, New York* 10003 (P30 CA 13343-08)

This proposal seeks continued support for a NCI Center Grant entitled 'Research in Environmental Cancer'. This Center Grant provides core support for the Institute in the area of cancer research including partial salary support for professional staff, developmental funds, and limited support for items of shared equipment and central services. The research and teaching program in cancer at the Institute has the broad objective of identifying environmental causes of cancer and developing methods for the control of carcinogenic hazards. The program is interdisciplinary in character and ranges from studies at the subcellular level on mechanisms of action to whole animal, epidemiological and environmental studies.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $478,976

3.0595,
CANCER CENTER CORE SUPPORT GRANT(COMPREHENSIVE)

J.R. Durant, University of Alabama in Birmingham, School of Medicine, Dept. of Medicine, *1919 7th Ave. S., Birmingham, Alabama* 35233 (P30 CA 13148-10)

The Comprehensive Cancer Center at the University of Alabama in Birmingham conducts programs in immunobiology, immunogenetics, genetics and cell biology, RNA virology, DNA virology, molecular biology, experimental pathology, x-ray crystallography, NMR spectroscopy, tumor immunology, membranes, surgical oncology, radiation oncology, gynecologic oncology, medical oncology, pediatric oncology, nursing, biostatistics, and dentistry. It provides shared resources for immunosuppressed mice, NMR, x-ray crystallography, animal radiation, biostatistics, media preparation and tissue culture, histology, tissue procurement, and electron microscopy and proposes to develop a shared resource in fluorescence. It proposes to develop a program in epidemiology and the sequencing of proteins and nucleic acids, and to continue to support promising young investigators.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $1,614,741

3.0596,
HUMAN RADIATION CARCINOGENESIS STUDY

E.D. Woodard, University of Rochester, School of Medicine & Dentistry, Dept. of Radiology, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (R18 CA 19764-04)

This application proposes continuation of long-term prospective studies of three well-defined populations irradiated for benign conditions: (1) persons whose thymus glands were irradiated in infancy; (2) persons given x-ray and/or radium treatments for hypertrophy of adenoidal tissue during childhood; and (3) women whose breasts were treated with x-rays for acute post-partum mastitis. The objective of the program is to determine the risk of radiation-induced disease (neoplasia, autoimmune and psychiatric illness) with particular attention to the dose-response relationship for neoplastic disease. A second objective is to detect (by periodic mammographic-thermographic screening) and treat early cases of breast cancer in a high-risk population (mastitis-irradiated series). Additionally, findings in the screening program will be evaluated for predictive significance.

The health of the irradiated subjects and their non-irradiated sibling controls is followed by mailed health questionnaire. Significant illnesses and operations are verified with the attending physician and/or hospital. Sections of neoplasms of selected sites (breast, thyroid, and salivary glands) are requested for review. The breast-irradiated women and eligible controls (NCI guidelines) will be offered annual mammographic-thermographic screening. Laboratory studies of B and T lymphocytes will be conducted on selected individuals in the thymus series. Additional dosimetry calculations will be performed for selected tissue sites in the head-irradiated series (thyroid, pituitary, and salivary glands) and thymus-irradiated series (breast tissue).

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $104,877

3.0597,

CHILDREN'S CANCER STUDY GROUP

R.L. Chard, Childrens Orthopedic Hospital & Medical Center, Division of Hematology Oncology, *4800 Sand Point Way N.E., Box C-5371, Seattle, Washington* 98105 (R10 CA 10382-15)

This proposal is for continuation of research into the natural history, treatment and epidemiology of the statistical conduct, design, collation, and publication of childhood cancer. It will continue to emphasize multimodal aspects of the Children's Cancer Study Group which has realized such excellent results in the past in Wilms' tumors and rhabdomyosarcoma and has now helped in defining acute childhood lymphocytic leukemia as more than one disease entity which requires different treatments for different groups. Also, treatment has been improved in osteogenic sarcoma and Ewing's sarcoma and, though advances are more meager, there have also been statistical improvements in survival of neuroblastoma patients. Childhood nonlymphocytic leukemia patients have also shown improved survival and the Children's Cancer Study Group has now combined in a Groupwide study to compare bone marrow transplantation in first remission to more standard conventional chemotherapy in a controlled fashion.

During the period from November, 1976 to December, 1979, 389 children with childhood cancer were seen at this institution; 182 with leukemia, 148 who were treated on study, 44 who were not on study, and 207 children with solid tumors. We have been a member of the Children's Cancer Study Group since 1959 and strong permanent referral patterns have been established. It is therefore anticipated that the patient load will continue to be stabilized and slightly increased over the next several years. A close working relationship with the adult leukemia center under Dr. E. Donnall Thomas at the Fred Hutchinson Cancer Research Center continues. This includes the exchange of professional personnel on the Fellowship level. Forty-three bone marrow transplantations on children with acute leukemia have been done at this institution from 11/1/76 to 12/1/79. Collaborative studies continue in immunology with the Fred Hutchinson Cancer Research Center, primarily through the efforts of Irwin D. Bernstein, M.D.

METABOLIC EPIDEMIOLOGY OF COLON CANCER

B.S. Reddy, American Health Foundation Inc., Naylor Dana Institute for Disease Prevention, *Hammond House Rd., Valhalla, New York* 10595 (R26 CA 16382-06)

OBJECTIVE: The overall objective of the proposed research is to: (a) acquire significant information on the mechanisms related to, and the role played by: dietary components, intestinal microflora and their metabolites on the etiology of colon cancer in man, (b) identify specific environmental and dietary components that either directly cause colon cancer or indirectly promote the formation and development of colon neoplasms, and (c) develop key biochemical and/or microbial indicators which distinguish low- and high-risk populations for colon cancer.

APPROACH: The proposed study will determine: the fecal cholesterol and bile acid metabolites and fecal bacterial 7 alpha-dehydroxylase, cholesterol dehydrogenase and nuclear dehydrogenase activities and fecal bacterial transnitrozation reaction in members of high-risk cancer families, patients with familial polyposis and healthy controls consuming a mixed-Western diet. We also continue the present study in determining the metabolic activity of fecal microflora (above enzyme parameters) in patients with colon cancer and adenomatous polyps to permit an evaluation of these discriminants for colon cancer. In addition, we propose to isolate and identify the mutagens (presumptive carcinogens) in the feces of above study populations.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $95,722

3.0599,

CORE CANCER CENTER SUPPORT GRANT

R.A. Cooper, University of Rochester, School of Medicine & Dentistry, Dept. of Pathology, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (P30 CA 11198-12)

The University of Rochester Cancer Center is a multidisciplinary Center with broad responsibilities for clinical research, primary and consultative interdisciplinary care, and conduct of coordinated programs in cancer education, nursing and basic research.

Clinical research and treatment in the Center is community based and involves a consortium of five general hospitals in Monroe County and affiliated hospitals in the Finger Lakes region. Clinical research emphasizes combined modalities and cooperative group trials and includes participation in R.T.O.G., E.C.O.G., PSYCOG, C.C.S.G., and G.O.G. An in-house clinical investigations committee translates basic research advances into clinical research.

Basic research is focused in fields particularly relevant to treatment advances. The integrating research theme of the Center is the comparative study of damage and repair of macromolecules and organelles critical to cell survival (DNA, RNA, and membranes) and the influence of these on treatment. Biostatistics-Epidemiology Registry, Experimental Pathology/Ultrastructural, Centrifugal Elutriation, and the Animal Tumor Research Facilities serve as broad, shared resources of the Center.

Complementing the core research programs are cancer control and cancer education programs. The Center is, thus, not only as a community, regional, and national clinical research resource, but also resource for basic research and for the development of education and cancer control models.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $1,469,506

3.0601,

DEVELOPMENTAL CANCER CONTROL PROGRAM (WISCONSIN)

R.O. Johnson, University of Wisconsin, Madison Campus, Medical School, Dept. of Human Oncology/Surgery, *450 N. Randall Ave., Madison, Wisconsin* 53706 (R18 CA 16405-05)

GOAL: To decrease the morbidity and mortality from cancer in Wisconsin.

OBJECTIVES: 1. Planning and Legislation. To develop a comprehensive plan for control of cancer in Wisconsin and a strategy for the plan's enactment into formal legislation. 2. Epidemiology and Evaluation. To further develop and maintain a strong WCCC biometry component to aid in the planning, implementation and evaluation of Wisconsin cancer control programs. 3. Public Information and Education. To develop and promote needed programs to inform the public about cancer. 4. Professional Information and Education. To conduct necessary and valuable programs to inform and educate health professionals about cancer. 5. Prevention and Early Detection. To promote optimal practices in cancer prevention and early detection. 6. Diagnosis and Treatment. To organize regional, cooperative, site-oriented programs, networks and task forces dedicated to improving the diagnosis and treatment of cancer. 7. Rehabilitation and Continuing Care. By demonstration, to inform the public and professional communities in Wisconsin about effective rehabilitation and continuing care possibilities and practices for cancer patients. 8. New Projects Development. To catalyze, encourage and support the development of new ideas in cancer control.

CANCER INCIDENCE AND RISK FACTORS BY KINSHIP

M.H. Skolnick, LDS Hospital, *325 8th Ave., Salt Lake City, Utah* 84103 (R01 CA 16573-06S1)

From a Utah Mormon genealogy of more than one million individuals linked to a Cancer Registry of more than 30,000 cases, we will: (1) Determine the genetic contributions to the occurrence of cancer for specific sites in a general population, including the estimation of heritability for specific age-sex categories. (2) Fit specific genetic models which will best explain any observed patterns of the occurrence of specific cancer sites or groups found to cluster in large pedigrees. Components of the models will include modes of inheritance and factors which influence gene expression (such as age, sex, and pertinent environmental factors when known). In-depth pedigree and chromosomal marker studies provide important additional data for this analysis. (3) Investigate the potential association of a large number of immunologic, biochemical, and anthropomorphic genetic markers to various forms of cancer in an effort to characterize these traits for people who are at high genetic risk for acquiring the disease and then attempt to use this information for early detection or prevention of the cancer.

CANCER CENTER SUPPORT GRANT

R.A. Cooper, University of Pennsylvania, School of Medicine, Dept. of Medicine, *36th & Hamilton Walk, Philadelphia, Pennsylvania* 19174 (P30 CA 16520-06)

The University of Pennsylvania Cancer Center (UPCC) study is a multidisciplinary program in cancer research, education and clinical care. Based in the School of Medicine, it involves faculty from many schools of the University. The UPCC is one component of the Fox Chase-U. of P. Comprehensive Cancer Center. Interdisciplinary clinical research programs of the UPCC exist in hematology-oncology, radiation therapy, surgical oncology and gynecologic oncology. A multidisciplinary program has been established in head and neck tumors, and similar programs are developing in neuro-oncology and urologic cancer. Clinical research programs utilize the shared resources of the Center's inpatient Oncology Study Unit, Clinical Trials Data Center, Pharmacology Core and Nutrition Support Service. Interdisciplinary fundamental research programs exist in immunobiology, cell biology, virology, genetics, and radiobiology. Program development involving tumor immunology and bone marrow culture is planned. Fundamental research programs utilize the shared resources of an animal breeding colony and tissue culture core, and they are strengthened by a Visiting Scientist Program. Acquisition of a fluorescence activated cell sorter is also planned. The Center's Epidemiology and Statistics Unit includes epidemiologic studies of occupational carcinogenesis and biostatistical research. The Unit established a biostatistics shared resource for the UPCC and a patient data system compatible with the CCPDS. A multidisciplinary Psychosocial Program, recently established, addresses needs in areas of research, service and education. Other Educational Programs have been established as well, and the UPCC provides a range of opportunities for medical and nursing students, fellows, practicing physicians and other health professionals. The UPCC Cancer Control Program extends to community hospitals in Pennsylvania and New Jersey. An information letter, Cancer Update, provides UPCC news and cancer education for Center members and other professionals who relate to the UPCC.

CASE CONTROL STUDY OF CARCINOMA OF THE ESOPHAGUS

T.M. Mack, University of Southern California, School of Medicine, Dept. of Community Medicine & Public Health, *2025 Zonal Ave., Los Angeles, California* 90033 (R01 CA 19496-05)

The study proposed is a large case control study to be performed prospectively in Los Angeles County. It has been designed to permit simultaneous examination of multiple antecedent risk factors.

Cases with cancer of the esophagus will be identified by the LAC/USC Cancer Surveillance Program. A questionnaire has been designed to obtain data on environmental exposures - tobacco and alcohol consumption, diet, occupation and medical history and treatment. It will be administered to both cases and neighborhood controls as soon as possible after the cases have been diagnosed. Standard matched pair analyses of multiple variables will be performed on the data from the questionnaire.

LYMPHOMA-LEUKEMIA PROGRAM/LAC-USC CANCER CENTER

R.J. Lukes, University of Southern California, School of Medicine, Dept. of Pathology, *2025 Zonal Ave., Los Angeles, California* 90033 (P01 CA 19449-05)

The Lymphoma-Leukemia Program is a unified multidisciplinary study of malignant lymphomas and related leukemias and immunoproliferative disorders that has as its goal the definition of their cellular and clinical characteristics in terms of modern understanding of immunology, including the T and B lymphocytic systems and alterations of lymphocyte transformation. It combines a multiparameter approach employing a variety of immunologic surface marker technics with cytochemistry, ultrastructural, in vitro and immunoglobulin detecting technics for the cellular definition and with in-depth Hodgkin's staging technics for the defining of clinical expressions. The results of the initial definitional phase during the first two years have demonstrated the effectiveness of this multiparameter definitional approach in characterizing human lymphoid neoplasms according to the T and B cell systems and relating these neoplasms to abnormalities of lymphocyte transformation and to the functional lymphoma classification of Lukes and Collins. A Southern California Lymphoma Group involving 28 major area hospitals also has been developed, as part of the regional collaboration to enhance the collection of fresh lymphoma case material for study. It also extends to the community the morphologic, technical and clinical expertise that influences the quality of patient care. This program interrelates with regional epidemiologic and cancer control programs. In the renewal phase of the program the definitional phase will be continued as a basis for in depth areas of investigation that have evolved out of the initial phase. These involve the following areas: IV. Control Mechanisms in Lymphoma Induction and Progression; V. Membrane and Cytoplasmic Immunoperoxidase; VI. Exploratory Data Analysis; VII. Animal Models; VIII. Cell Surface Receptors and Antigens; IX. Cell Kinetics; X. Cytogenetics; XI. Role of Stromal Cells; XII. HLA and B Cell Typing; XIII. Epidemiology.

CANCER CENTER SUPPORT (CORE) GRANT

S.K. Carter, Northern California Cancer Program Inc., *770 Welch Rd., Suite 190, Palo Alto, California* 94304 (P30 CA 19408-05)

NCCP, through the efforts of Dr. Carter and staff will continue to provide administrative and scientific leadership throughout the region on state and national cancer issues. Specifically, in clinical research, NCPP will continue to be forum for collaboration and mechanism for developing and managing multi-institutional and community based research efforts. NCPP will coordinate under the Biological Response Modifiers program from the Division of Cancer Treatment. Drs. Carter and Torti will continue to integrate clinical research efforts with NCCP programs in Basic Science, Cancer Control, Community Outreach and Epidemiology. Dr. Taber will further develop cooperative research projects in anti-cancer drug development along the lines described in the progress report.

NCCP will provide leadership in the development of a state cancer plan and legislation and policies designed to address the cancer problem in California. Martha Kaplan, M.P.H. will continue to staff this effort.

In conjunction with NCCP's regional affiliates throughout the region the Core grant will provide the resources to coordinate local activities in data collection, tumor registry development, plan and program development that make the NCCP a truly active cancer center without walls.

We also anticipate the recruitment of a senior epidemiologist who will further expand our collaborative efforts throughout the NCCP region.

GENETIC EPIDEMIOLOGY OF CANCER

K.M. Weiss, University of Texas, Health Science Center at Houston, Graduate School of Biomedical Sciences, Center for Demographic & Population Genetics, *P.O. Box 20334, Houston, Texas* 77025 (R01 CA 19311-04)

This study will link vital records of the Mexican-American city of Laredo, Texas into extended genealogies. These records consist of civil and church birth, death, marriage, and other records. Cause of death will be mapped onto the assembled genealogies with respect to death from various forms of cancer. Genetic models for heterogeneity in cancer susceptibility will be tested. The demographic epidemiology of death, when many causes compete and age of onset is variable, will be studied using this population. A first-order assessment of environmental effects in familial clustering of cancer deaths will be made. Laredo is over 90 percent Mexican-American and Roman Catholic. By use of 1900 as a base population, this study will have a well-ascertained, large, isolated population as its basis, and will contribute to cancer genetics and epidemiology and to the epidemiology of disease in Mexican-Americans in general.

OPTIMIZATION OF SCREENING FOR CERVIX CANCER

B.A. Barron, Columbia University, College of Physicians & Surgeons, Dept. of Obstetrics & Gynecology, *630 W. 168th St., New York, New York* 10032 (R01 CA 19145-05)

Cancer of the uterine cervix contributes significantly to the total cancer morbidity and mortality among women in the United States. Cytologic screening using the Papanicolaou smear has become a widely accepted modality for detecting cervical neoplastic disease. The cost-effectiveness of Papanicolaou smear screening on an annual basis has been questioned. Recently, recommendations have been made for modifying current practices by increasing the interval between successive cytologic examinations among those women identified as being at 'low risk' of incidence. In no instance have the sequelae of such proposed changes been examined in terms of expected changes in incidence, survival and mortality for cancer of the cervix.

The natural history of cervical neoplastic disease has been described by us and other investigators. Several cytologically defined lesions are thought to be precursors of invasive cancer of the cervix and there is wide acceptance that carcinoma-in-situ is antecedent to invasive disease. This lesion is potentially 100% curable and will, if untreated, progress to invasive cancer in the majority of cases. The transition times and probabilities of the stages of cervical neoplastic disease have been presented previously. Using these data together with age-specific incidence rates currently available from a variety of sources and available estimates of incidence, the studies proposed here will generate estimates of the incidence, survival and mortality for cervix cancer among defined populations exposed to specified cytologic screening regimens.

CANCER CENTER SUPPORT (CORE) GRANT

E.L. Wynder, American Health Foundation Inc., *320 E. 43rd St., New York, New York* 10017 (P30 CA 17613-06)

This grant provides funding for principal personnel and central services for the overall prevention-oriented research program at the American Health Foundation. Support services include a research animal facility, and instrumentation, histology, and computer facilities. The Foundation's research program includes projects in cancer epidemiology, chemical carcinogenesis in animal models and cell culture, effects of cigarette smoke and chemical characterization of smoke from various tobaccos, cancer control through risk factor identification and reduction programs in schools and the workplace, and related economic studies. Other laboratory studies cover diet-related investigations of carcinogenesis of the colon, prostate, and other sites.

USC CANCER CENTER EPIDEMIOLOGY AND BIOSTATISTICS UNIT

B.E. Henderson, University of Southern California, School of Medicine, Dept. of Pathology, *2025 Zonal Ave., Los Angeles, California* 90033 (P01 CA 17054-04A1)

This proposal requests continuing support for an Epidemiology and Biostatistics Research Program as a major component of the Los Angeles County/University of Southern California Cancer Center.

A large part of the research effort is the Cancer Surveillance Program (CSP) headed by Dr. Thomas Mack. The CSP provides prompt reporting and detailed demographic data on virtually all new cancer cases diagnosed in the entire population of seven million residents of Los Angeles County. A major function of the CSP is to provide cancer patient identification for etiologic field studies. The descriptive information from the CSP provides additional etiological clues and a system for checking the consistency of suggested causal associations with cancer rates in the population. The CSP also identifies high risk program targets, and constitutes a cancer research organization with a presence in each of the county's diagnostic facilities.

The Biostatistics Unit headed by Dr. Malcolm Pike supports some field staff as well as the analytic component of our field studies. Development of new statistical methods to deal with these field studies and other cancer related studies is also undertaken by this unit. Funds for most field studies are currently being obtained from several research contracts and grants. The desirability of having the capability of making a rapid and flexible response to newly sug-

gested hypotheses demands some field staff without unalterable commitments.

CHLORINATED WATER AND MEMBRANE FUNCTIONS AND NEOPLASIA
A.Y. Sun, University of Missouri, Columbia Campus, Sinclair Comparative Medicine Research Farm, *Rte. 3, Columbia, Missouri* 65201 (R01 CA 26586-02)
Chlorine is suspected to be a cancer risk because it interacts with organic matter in water and in biological systems leading to the formation of various toxic chloroderivatives. The overall objective of this proposed study is to investigate the interaction of chlorine and/or chlorinated compounds with the cellular constituents under the physiological condition in relation to the biochemical mechanism of tumor formation as induced by this interaction. Specifically, we shall: (1) study the effect of acute and chronic treatment of chlorinated water on the structure and function of biological membranes, (2) evaluate synergism and promotion in tumorigenesis when chlorine water ingestion is combined with other chemical carcinogens and (3) examine the inhibitory effect of dietary antioxidants on the chemical carcinogenesis as induced by chlorine and dimethylnitrosamine (DMN). The change in the compositions (lipids and proteins) and functions (membrane-bound enzymes, transport activities) of erythrocyte membranes, kidney and liver mitochondria and synaptic plasma membranes will be studied and compared in control and experiment animals. The growth rate, tumor incidence and associated histological and membrane change with either chlorine or combined with DMN administration will be examined. In addition, the inhibitory effect of dietary vitamin E and selenium on the chemical carcinogenesis as induced by chlorine alone or in combination with DMN will be evaluated. It is anticipated that the result of this investigation will provide more information about the prevalence of mutagenic agents in drinking water and in the biological system. Possible preventive measures to the chemical carcinogenesis may be developed as a result of this study.

IN VIVO NITROSAMINES AND CANCER IN RENAL FAILURE
M.L. Simenhoff, Thomas Jefferson University, Jefferson Medical College, Dept. of Medicine, *1025 Walnut St., Philadelphia, Pennsylvania* 19107 (R01 CA 26571-02)
The research study will try to answer the question whether in vivo generation of volatile nitrosmaines occur in the gut of patients with chronic renal failure. This is proposed because of the finding that bacterial overgrowth and high levels of secondary amines occur in the proximal small intestine in patients with advanced kidney failure. A high incidence of cancer in end-stage kidney disease has been reported from various parts of the world including the United States. We are currently examining biological fluids in patients with end-stage kidney disease for precursor compounds and nitrosamines. These measurements for nitrosamines are being performed by gas chromatography thermal energy analysis. Also, and epidemiological survey is being carried out to define more carefully the true incidence of cancer in chronic renal failure. Preliminary results show that nitrosamine generation is occuring in water treatment systems used for dialysing patients with chronic renal failure. Because of the potential danger of this finding, exact definition of this occurrence is being intensively studied. A source for ex vivo nitrosamine formation has been identified in dialysis units, and measured in the blood of patients where such nitrosamine production has occurred. The implications of this work are obvious in reviewing water treatment systems.

DETROIT SSMA POPULATION-BASED CANCER REGISTRY
M.J. Brennan, Michigan Cancer Foundation, *110 E. Warren Ave., Detroit, Michigan* 48201
OBJECTIVES: Maintain a cancer information system in the three counties of the Detroit metropolitan area. Collect data in sufficient detail so that each cancer can be classified and coded. Collect complete information regarding extent of disease, diagnostic procedures, and first cause of cancer directed therapy on all patients diagnosed since 1973. Utilizing all available methodologies, obtain active follow-up of all cases diagnosed since 1973. In conjunction with participation in the SEER Program, cooperate with NCI field staff in its quality control activities. Maintain a core staff including both professional and technical people. Submit annual progress reports in August of each year. Conduct, in consultation with the Computer Science Section of NCI, a detailed analysis of the current data processing system and develop a detailed plan to upgrade the existing system.

METROPOLITAN ATLANTA SEER PROGRAM
M.A. Child, Emory University, School of Medicine, Dept. of Medicine, *1364 Clifton Rd. N.E., Atlanta, Georgia* 30322
As a participant in the SEER Program, this Contractor is to provide data for incidence and end results reporting on all cancers diagnosed among residents of the Metropolitan Atlanta area. During the initial contract period, the Contractor will undertake the planning and development of data acquisition, coding, processing, and editing necessary to the implementation of the SEER Program in the Atlanta Metropolitan area. During the second contract period, the reporting system will concentrate on cases diagnosed during 1976 and may, as time allows, pick up cases diagnosed during 1972-1975 so that continuous incidence data from 1969 forward will be available by virtue of Atlanta's participation in the Third National Cancer Survey. The data are to be recorded in accordance with rules agreed upon by SEER Program participants and will periodically be submitted to the Biometry Branch, NCI, for analysis.

PROSPECTIVE STUDY OF DIET AND CANCER IN WOMEN
F.E. Speizer, Harvard University, Boston Campus, Peter Bent Brigham Hospital, *721 Huntington Ave., Boston, Massachusetts* 02115 (R01 CA 26560-02)
This study is designed to address questions regarding the possible association between the intake of various dietary components and cancer of the breast and large bowel, as well as other disease outcomes. This is to be done by taking advantage of an existing prospective study of risk factors for breast cancer in 121,000 women who complete a mail questionnaire on a biennial basis.
The questionnaire is designed to provide relative scores for individuals on: intake of animal fat, vegetable fat, cholesterol, potein, fiber, Vitamin A, and 'trans' fatty acids. Data on potential confounding factors, including physical activity, for risk of breast cancer and large bowel cancer are being collected and will be controlled by multiple logistic analyses. To validate the questionnaire, 200 subjects will complete detailed 7-day food use diaries four times over 1-year period. Blood specimens will be assessed for carotene and vitamin A levels.
Outcome measure will include both fatal and non-fatal cancer incidence rates. Reported cases of cancer will be documented by obtaining copies of hospital records and causes of death will be obtained from death certificates as well as hospital records.
SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $142,686

RELATIONSHIP BETWEEN CHOLECYSTECTOMY AND ASCENDING COLON
L.H. Kuller, University of Pittsburgh, Graduate School of Public Health, Dept. of Epidemiology, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (R01 CA 24739-03)
Bile acids and/or by-products as a result of bacterial degradation are believed to be related to large bowel carcinogenesis. Cholecystectomy has been shown to alter bile acid metabolism. A retrospective study involving 706 cases of large bowel cancer grouped by subsite, sex, and age, identified during the Third National Cancer Survey was recently completed. Thirty-eight of 291 patients (13%) with cancer of the ascending or transverse colon (right-sided large bowel cancer) had hospital records indicating a history of prior cholecystectomy as compared to 26 of 415 patients (6.3%) with descending, sigmoid, or rectal cancer (left-sided large bowel cancer). When comparing right-sided large bowel cancer patients with left-sided large bowel cancer patients, the estimated relative risk was found to be 2.23 with 9% confidence limits of 1.33 to 3.75. Although the results are significant, a possible bias associated with review of hospital records could account for this relationship. Therefore, we are currently replicating this study and validating prior history of cholecystectomy in hospital records. Operative notes and X-rays have been reviewed to validate the absence or presence of the gallbladder at time of colon cancer surgery. Interviews with the surgeon and/or family are also being conducted. Finally, a neighborhood control group is also being interviewed.
BIBLIOGRAPHIC REFERENCES: Vernick, L., Kuller, L., Lohsoonthorn, P., Rycheck, R., and Redmond, C. Cholecystectomy: A risk factor in right-side colon cancer? Am. J. Epidemiol. 110:353, 1979 (Abstract).

CANCER STUDIES IN WASHINGTON COUNTY, MD
G.W. Comstock, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (R01 CA 24758-03)
The proposed project has several related objectives. First is to maintain a serum-bank and cancer registry as a facility for studies of the epidemiology of major cancers, with special reference to serum factors

antedating the diagnosis with serum assays of matched control specimens drawn at the same time, and also comparing serum assays of cancer cases before and after diagnosis which will identify risk factors, thereby adding useful knowledge of cancer etiology and helping to focus preventive practices. The second objective is to compare serum estrogen and androgen levels in serum specimens drawn in 1974 from breast cancer cases diagnosed since that time and their matched controls. The control experience will also be useful to see if serum hormone levels are related to other breast cancer risk factors. An additional study will measure disability and mood among breast cancer cases and age-matched controls. This will confirm and amplify a preliminary study that indicated that disability and mood changes observed in women several years after mastectomy resulted from age and not from their diagnosis or treatment.

A fourth objective is to study serum estrogen and androgen levels among groups of postmenopausal women from a general population. Sufficient numbers of serum specimens can be examined to allow reasonably firm conclusions about normal levels in this cancer-prone age group and to relate these levels to a variety of personal characteristics. Finally, it is proposed to ascertain if there are long-term changes in a variety of serum hormone levels with storage at minus 70 degrees C. This information is not currently available and is badly needed not only for this study, but also for other investigations that rely on frozen serum specimens.

EPIDEMIOLOGY OF APLASTIC ANEMIA IN BALTIMORE

M. Szklo, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (R01 CA 24757-03)

The objectives of this study are: Phase I - the examination of temporal trends in incidence rates of aplastic anemia (AA) and acute nonlymphocytic leukemia (ANLL; Phase II - examination of the role of environmental agents in AA and ANLL by means of a case-control epidemiologic investigation.

Phase I of the study is almost completed. Thus far, 140 cases of AA and 723 cases of ANLL have been identified through a hospital record search. Death certificate search is underway and should help to ascertain additional cases. Additionally, a search will be carried out of hospital records at the NIH Clinical Center, in order to identify possible cases who may have sought care in the D. C. area.

Phase II of the study will start in December, 1980. Procedures for the collection of data, as well as selection of controls, have been designed.

PROSTATIC CANCER - GENETIC AND ENDOCRINE RISK FACTORS

A.W. Meikle, Utah Higher Education System, University of Utah, School of Medicine, Dept. of Internal Medicine, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (R26 CA 25031-03)

Our major goal is to determine the role of genetic factors in the development of prostatic cancer. Our hypothesis is that genetic factors affect secretion of sex-hormones and prolactin and predispose men to the early development of prostatic cancer in response to endogenous hormones and environmental carcinogens. Our probands will be less than 61 years of age when the diagnosis of prostatic cancer is made. We will determine whether (1) the plasma concentrations of sex steroids (estradiol-17beta, estrone, testosterone and dihydrotestosterone) and prolactin are abnormal in probands and first-order relatives as compared to age-matched in-law controls and whether the plasma concentrations of the hormone are affected by heredity; (2) the risk of the development of prostatic cancer is higher in first-order relatives and maternal and paternal relatives of the index cases than in age-matched controls; (3) the prevalence of some apparent epidemiologic risk variables are observed more commonly in probands and their first-order relatives as compared to age-matched controls. The investigation is novel in that the hereditary, endocrine and epidemiologic risk variables for the development of prostatic cancer will be investigated in younger men with the cancer and their relatives.

The investigation is feasible because of the availability of a population with large families and a high incidence of prostatic cancer.

MALE ROLE IN CERVICAL CANCER

I.I. Kessler, University of Maryland, Baltimore Professional Schools, School of Medicine, Dept. of Social & Preventive Medicine, *655 W. Baltimore St., Baltimore, Maryland* 21201 (R01 CA 25019-03)

Funds are requested to renew our ongoing study on the role of the male sex partner in the etiology of cervical cancer. The considerable evidence for the relationship between cervical cancer and venereally transmitted genital herpesvirus HSV-2 has been augmented by preliminary findings from this study which are strongly suggestive of a significant male role in cervical carcinogenesis.

Our prospective study is designed to test the venereal hypothesis in cervical cancer pathogenesis. We are seeking a scientifically valid answer to the following question: Is the risk of developing cervical cancer increased in the current wives of men who - at some other time were married to other women who developed this disease?

Over the past 25 years we have identified nearly 4,200 women with histopathologically confirmed cervical cancer. The husbands of these women are being followed up for the purpose of identifying all their previous and subsequent wives who in turn are traced prospectively through time. The lifetime risk of cervical cancers of these 'case' wives is then compared with that of a cohort of demographically similar 'control' wives. This approach affords an epidemiologically valid test of the role of HSV-2, or any other venereally transmitted male factor, in cervical cancer.

At present, marital clusters of cervical cancer have been confirmed in both wives of each of 45 men, with somewhat more than 1000 husbands and 'other wives' to be traced.

Our work was substantially disrupted by the transfer from Johns Hopkins to the University of Maryland. Funds are requested to complete this unique project.

A PROSPECTIVE STUDY OF CANCER RISK IN TUBERCULOSIS

I.I. Kessler, University of Maryland, Baltimore Professional Schools, School of Medicine, Dept. of Epidemiology & Preventive Medicine, *655 W. Baltimore St., Baltimore, Maryland* 21201 (R01 CA 25018-02S1)

Interest in the hypothesized association between tuberculosis and cancer has been intensified by studies demonstrating that tubercle bacilli (i.e.BCG) potentiate host immune responses against cancer challenge. Recent experiments in man suggest that BCG acts not only to evoke non-specific cell-mediated immunity but also to increase host resistance against specific tumors such as melanoma, sarcoma and breast cancer.

In view of the above, a type of natural experiment in cancer prevention is underway. A large cohort of tuberculosis patients is being followed prospectively through time to death or suuvival as of December 31, 1974. The outcome variables of interest are cancer mortality and morbidity. Observed cancer risks will be compared with those of the general population similar in age, sex and race. Additional analyses will focus upon cancer risk according to clinial severity of tuberculosis, with adjustment for smoking habit. Consideration will also be given to cancer risks among close family members as a further test of the antitumor immunogenicity of exposure to tuberculosis.

The prospective design of this study is relatively free of biases inherent in earlier efforts. This will also make possible the study of the association between tuberculosis and all types of cancer. A significant relationship between the two could suggest the possibility of BCG or tuberculin vaccination as a cancer preventive.

3.0626,
BREAST PARENCHYMAL PATTERNS AND BREAST CANCER RISK

A.S. Morrison, Harvard University, Boston Campus, School of Public Health, Dept. of Epidemiology, *55 Shattuck St., Boston, Massachusetts* 02115 (R01 CA 24797-02)

The principal objectives of this study are: a. To evaluate the relationship between specific mammographic parenchymal characteristics and the incidence of female breast cancer; b. to evaluate the relationship between mammographic parenchymal characteristics and risk factors for breast cancer.

Other objectives are to identify histologic correlates of mammographic parenchymal characteristics and to evaluate both right-left concordance of parenchymal pattern, and observer reliability in the assessment of these patterns.

All women (including 800 new cases of breast cancer) having xeromammograms in any of seven collaborating radiology units during 1978 or 1979 will be enrolled. Information on status with respect to breast cancer risk factors, parenchymal pattern (Wolfe's classification) and pathologic diagnosis will be obtained from the subjects' radiology records. From this series, 400 cases and 800 controls, equally divided between the age groups less than 55 and 55-74, will be selected for a detailed 'blind' review of both xeromammogram and histologic slides. For women in each age group relative risk of breast cancer according to parenchymal pattern, with the N1 pattern as the referent, will be estimated. If necessary, these estimates will be corrected for confounding by other risk indicators. Possible interactions will also be quantified.

CASE-CONTROL STUDY OF LUNG CANCER AND DIETARY VITAMIN A

L.N. Kolonel, University of Hawaii System, Manoa Campus, Pacific Biomedical Research Center, Epidemiology Program, *2538 The Mall, Honolulu, Hawaii* 96822 (R01 CA 26515-02)

This case-control study will test the hypothesis that dietary vitamin A may be protective against the development of lung cancer.

We will take advantage of the multiethnic population of Hawaii, with its dietary heterogeneity, to interview 500 newly diagnosed patients with primary lung cancer. These patients will be identified through the seven major hospitals on Oahu and will be men and women of Japanese, Caucasian, Filipino, Chinese and Hawaiian ethnic groups. For each lung cancer patient, two age- and sex-matched controls will be identified using the random-digit dialing method. Both cases and controls will be interviewed in their homes by trained multilingual interviewers, using a questionnaire designed to elicit quantitative information on the consumption of a large number of dietary items containing preformed vitamin A and vitamin A precursors. A detailed smoking history and history of exposure to occupational lung carcinogens will also be part of the questionnaire.

The data will be analyzed to determine the dietary vitamin A consumption of cases and controls with adjustment for smoking and occupational history. Further analysis will determine the dietary vitamin A consumption of cigarette-smoking cases versus cigarette-smoking controls with adjustment for covariates. The demonstration of relatively low dietary vitamin A intake among lung cancer patients, particularly among those who are smokers, would suggest that the incidence of this very common cancer might be reduced by increases in vitamin A intake.

EPIDEMIOLOGIC AND HLA STUDY OF LEUKEMIA

M. Szklo, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (R01 CA 26500-02)

The major objective of this research is to study the postulated association between CLL and chronic antigenic stimulation (related to infections, inflammatory processes and autoimmune diseases) by means of medical chart review and interview in a case-control study. We are also exploring the postulated increased familial incidence of CLL and other lymphoproliferative malignancies. We are examining possible associations of CLL with occupation, smoking, alcohol use, immunizations and operative procedures involving the lymphoproliferative system (tonsillectomy, splenectomy, etc.) in order to develop additional etiologic hypotheses.

A medical record room search of all Baltimore SMSA hospitals is one of the prime sources for ascertaining cases. Physicians have reviewed 339 charts at 2 of the 3 major university hospitals and at 2 of the largest community hospitals where a large proportion of CLL cases are expected to have been seen. At present, this has yielded 121 cases diagnosed as CLL. Actually, 11/121 (9%) cases called CLL did not meet the criteria for CLL as established by the NCI CLL/Myeloma Task Force because of absolute lymphocyte counts less than 15,000/mm3. 28/121 (23%) of cases called CLL are probably cases of well-differentiated lymphocytic lymphoma.

Each case is matched with two controls with any malignancy other than a lymphoproliferative neoplasm and two controls with any non-malignant disease. The matching variables include age (within 5 years), sex, race, date of diagnostic admission and hospital of admission.

We have just begun the interview and blood-drawing portion of the study. We hope to identify differences in HLA types between patients with CLL and controls. We will then attempt to correlate these differences with epidemiologic and clinical characteristics of the various subgroups of our population of cases and controls.

BREAST CANCER DETECTION BY BREAST SELF-EXAMINATION

R.S. Foster, University of Vermont & State Agricultural College, School of Medicine, Dept. of Surgery, *85 S. Prospect St., Burlington, Vermont* 05401 (R18 CA 26363-01)

We propose studies to obtain data to confirm or refute the hypotheses: 1. That breast self-examinaton can lead to earlier breast cancer detection and decreased breast cancer mortality, and 2. that public health education programs can significantly increase the frequency and quality of breast self-examination in a population of women.

We plan to extend our previous findings which suggested a relationship between increased frequency of breast self-examination performance and more favorable clinical and pathologic stages of breast cancer. This will be done by determining the relationship between breast self-examination performance and breast cancer mortality. Studies are planned to determine the effect of public education on the frequency and quality of breast self-examination performance. A public health education program on breast cancer and breast self-examination was conducted in the State of Vermont during the years 1974-1978 and it is our intention to determine the effect of that program on both the clinical and pathologic stages of breast cancer in Vermont women in the years 1979 through 1984.

BLADDER CANCER RISK FACTORS IN UTAH

D.W. West, Utah Higher Education System, University of Utah, School of Medicine, Dept. of Family & Community Medicine, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (R26 CA 26362-02)

Previous epidemiological studies have identified several risk factors in the etiology of bladder cancer and a national study has been completed recently to determine whether these factors are associated with the disease. This was a case-control study of incidence cases in defined geographic areas and randomly selected population controls. Utah participated in this 12-month study, but the number of cases identified in Utah in 12 months (127) will not allow adequate sample size to perform the multivariate analysis techniques needed to test several important hypotheses. Since coffee and tobacco consumption are low in the Utah population, hypotheses concerning these risk factors can be studied without the problems found in other populations where the groups of non-users are small. In particular, coffee can easily be studied in Utah, as well as caffeine and the interaction of both with tobacco in the etiology of bladder cancer. Urban-rural differences and an increasing incidence for older males have also been noted in the state and identification of risk factors for these findings may suggest new hypotheses. The proposed plan will utilize the same design as used in the national study, but collect more data on coffee consumption. This will be done for two years and a year will be necessary for data analysis.

3.0631,

EPIDEMIOLOGIC STUDY OF CHILDHOOD GLIOMAS

P.C. Nasca, State Bureau of Cancer Control, *Empire State Plaza, Tower Bldg. Rm. 565, Albany, New York* 12237 (R01 CA 26194-02)

Our general objective is to determine, by means of an epidemiologic case-control study, the importance of various prenatal and childhood environmental exposures in the etiology of childhood gliomas. Special emphasis will be placed on prenatal and early childhood exposures to drugs, chemicals, radiation, tobacco, immunizations and animals. Selected birth characteristics including maternal age, parity and season of birth will also be examined.

Approximately 400 patients with childhood gliomas should be available for study. This sample size and a control-to-case ratio of 2:1 shall enable us to investigate the study variables with respect to the more common histologic subtypes. Demographic, pathologic and clinical data will be collected from the hospital records of each patient, utilizing a standardized form. Further data will be collected through telephone interviews with the mothers of each patient and control. These will be validated by comparing the mothers' responses with physician and hospital records.

FIBROCYSTIC BREAST DISEASE - EPIDEMIOLOGY AND HISTOLOGY

J.L. Kelsey, Yale University, School of Medicine, Dept. of Epidemiology & Public Health, *333 Cedar St., New Haven, Connecticut* 06510 (R01 CA 26021-02)

This case-control epidemiological study will examine the relationship between use of oral contraceptives and fibrocystic breast disease categorized histopathologically according to the extent of epithelial atypia; the specific hypothesis stating that there is a positive association between long-term use of oral contraceptives and the degree of epithelial atypia will be tested. Cases will be women who have had fibrocystic breast disease diagnosed from biopsy at four large Connecticut hospitals over a 22-month period. Their slides will be read by a pathologist associated with the study, and classified according to extent of epithelial atypia. Controls will be women admitted as inpatients or outpatients to certain surgical services of these same hospitals. Information on oral contraceptive use, demographic characteristics, and other variables of interest will be obtained from cases and controls by means of a structured questionnaire administered by trained interviewers, supplemented by queries to physicians. Previous use of oral contraceptives and exposure to other factors of interest will be studied in four groups categorized according to extent of epithelial atypia, as well as in controls, and the results will be compared. This study should increase our knowledge of the epidemiology of fibrocystic disease and potentially our understanding of the epidemiology of breast cancer, since fibrocystic disease with marked epithelial atypia has been found to be the form of fibrocystic disease most strongly associated with subsequent breast cancer.

EPIDEMIOLOGY OF UROTHELIAL CANCER IN HAWAII

A.M. Nomura, University of Hawaii System, Manoa Campus, Pacific Biomedical Research Center, Epidemiology Unit, *2538 The Mall, Honolulu, Hawaii* 96822 (R26 CA 25903-02)

This study will investigate the association of urothelial cancer with coffee, artificial sweeteners, hair dye, vitamin A and vitamin C in two ethnically-distinct groups which have different levels of risk for this disease (high risk for Caucasians and intermediate risk for Japanese). It will also include data on the association of this cancer with cigarettes and occupation. An attempt will be made to identify all initially-diagnosed cases on the Hawaiian island of Oahu during the period of the study. For each case, two controls from the general population, matched by sex, race, and age within three years, will be identified and interviewed. The questionnaire and format of the study is similar in design to an ongoing case-control study being conducted by the Harvard School of Public Health in three different populations (including the low risk Japanese in Nagoya, Japan). By this arrangement, we will be able to compare the findings between the Japanese in Hawaii and Nagoya, as well as between the Caucasians and Japanese in Hawaii to identify factors which may contribute to the difference in risk between the respective groups.

EVALUATION OF LOW LEVEL PLUTONIUM AND CANCER

C.J. Johnson, Jefferson County Health Dept., *260 S. Kipling St., Lakewood, Colorado* 80226 (R01 CA 25729-02)

Because of documented contamination of a large area of land with plutonium and other transuranic radionuclides in the vicinity of the Rocky Flats nuclear weapons plant in the Denver Standard Metropolitan Statistical Area, there is community concern regarding possible health effects in populations living in this area as well as concern for the safety of further residential development near the plant. A preliminary study of age-corrected cancer death rates in eight contaminated census tracts around the plant compared with a control area of 19 census tracts with a similar population in a relatively uncontaminated part of the S.M.S.A. disclosed a significant increase in deaths from Leukemia and lung cancer in the contaminated area. The study has been expanded to evaluate incidence and mortality rates of leukemia, lung cancer, and other types of cancer in census tract areas selected by concentrations of plutonium in soil or in surface respirable dust. The first phase of the study is the evaluation of cancer incidence in the contaminated and uncontaminated census tract areas of the S.M.S.A., utilizing data from the Third National Cancer Incidence Survey of 1969-71 by the National Cancer Institute. Cancer incidence in the contaminated areas, corrected for age, sex, race, ethnicity, income and education, will be compared to that in the uncontaminated census tract area of the S.M.S.A. by several methods, including regression analysis. The second phase is the evaluation of cancer death rates between 1970 and 1980, and the third phase will be an analysis of cancer incidence in the period 1979-81, using the same study and control areas as in the first phase. Cancer death and incidence data will be supplied by the Colorado Health Department, Division of Vital Statistics and the Colorado Cancer Registry. The effects of exposure to small concentrations of plutonium and other transuranics on a general population living in a contaminated area has never yet been evaluated with this epidemiologic approach, and the results will be of considerable value in selecting sites for plutonium processing plants and nuclear-electric generating plants in relation to population centers.

This study will be followed by a prospective study extending to 1991 (Phase four).

EPIDEMIOLOGY OF CANCER OF THE RENAL PELVIS AND URETER

R.K. Ross, University of Southern California, School of Medicine, Dept. of Family & Preventive Medicine, *2025 Zonal Ave., Los Angeles, California* 90033 (R01 CA 25669-02)

The proposed research is a continuation of a case-control study of the epidemiology of cancer of the renal pelvis and ureter in Los Angeles County. The study is designed to test for multiple antecedent risk factors or these diseases with special emphasis on prior heavy analgesic consumption, occupational exposures, cigarette smoking, and coffee consumption. The study is in year 2 of a proposed five-year program. The final case group will consist of 200 cases of carcinoma of the renal pelvis and ureter identified by the Los Angeles County/USC Cancer Surveillance Program. Controls are neighborhood controls individually matched to the cases by date of birth (plus or minus 5 years), sex, and race.

Data are obtained by telephone interviews conducted by a trained nurse epidemiologist with questionnaire information focusing on the above items. The study will evaluate the relative importance of each of these suspected risk factors in disease development and, for analgesic usage, the specific analgesic component responsible for increased risk.

DIET AND COLON CANCER IN MAN - THE EFFECTS OF FIBER

A.W. Sorenson, Utah Higher Education System, University of Utah, School of Medicine, Dept. of Family & Community Medicine, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (R01 CA 25580-01)

This case-control study will attempt to find relationships between dietary fiber and colon cancer etiology. The dietary fiber intake of Utah residents, a population at low risk of colon cancer, is believed to be higher than that of other U.S. populations because of the high consumption of home preserved foods, i.e., fruits, vegetables and cereal grains.

Both commercial and home preserved foods will be assayed for the fiber components, cellulose, hemicellulose, lignin, pectin and other selected vitamins, minerals and trace elements thought to be related to colon cancer. Using this nutrient data base and interview schedules, the dietary fiber intake will be determined for Utah colon cancer patients and a randomly selected control group and differences in diet noted. Dietary intake data will also be compared to serum lipids, and trace elements and to fecal steroids found in specimens collected from subsample of cases and controls. A second part of the study is concerned with determining the effect of the various types of dietary fiber on selected enzyme systems thought to be related to colon cancer and other cholesteremic diseases.

PRIMARY PREVENTION OF CANCER IN CHILDHOOD

C.B. Arnold, American Health Foundation Inc., *320 E. 43rd St., New York, New York* 10017 (R18 CA 25521-01)

Nine hundred students, initially ages 9 and 10 years, will take part in a controlled clinical trial in which the major objective will be: (1) To identify major cancer and other disease risk factors. (2) To reduce elevated risk status through planned intervention activities. (3) To reinforce and maintain reduced risk status.

The major outcome sought will be the primary prevention of cigarette smoking through a peer group approach. In addition nutrition activities will seek to improve nutritional habits and decrease clinical indices of overnutrition. Four program components will provide a motivational sequence of events favoring health-related behavior change. These components are (a) screening, (b) return of screening results to child, (c) curriculum education materials, and (d) anti-smoking and other interventions. Evaluation will be done by comparing smoking onset rates in study versus control schools. In addition, overall risk index scores will be compared as determined from annual re-screening and questionnaires.

3.0638,

STUDY OF MALES EXPOSED IN UTERO TO DIETHYLSTILBESTROL

L.T. Kurland, Mayo Foundation, *200 1st St. S.W., Rochester, Minnesota* 55901 (R01 CA 25441-03)

DES (diethylstilbestrol) has been shown, in studies of animals and on a small scale in humans to be associated with genitourinary abnormalities and possible reduced fertility in males exposed to the drug in utero. Human studies to date do not demonstrate an association with cancer in the DES-exposed male. However, preliminary reports of case control studies in progress have suggested such an association. Whether the exposed young men will have an increased propensity to develop cancer at a later date remains speculative.

The proposed study is primarily designed to determine if DES-exposed males are at a higher risk of genitourinary problems or infertility than non-exposed males. This would be accomplished by identifying and examining a cohort of 300 DES-exposed and 300 non-exposed males and by a follow-up over a 2-year period. The DES-exposed males will be identified through the DESAD Project (the study of DES-exposed females) at Mayo Clinic. The young men will be examined for clinical abnormalities and variations in levels of FSH, LH and testosterone. It is expected that the study will give further information regarding the prevalence of abnormalities in DES-exposed males-information relating to the role of DES in teratogenesis and the public health aspects of the problem. Ultimately, this study should lead to greatly increased accuracy of assessment of the health status of the DES exposed men and to recommendations regarding their long-term surveillance (and health care, if needed).

CERVICAL CANCER EPIDEMIOLOGY IN PANAMA

W.C. Reeves, Gorgas Memorial Inst. of Tropical & Preventive Medicine Inc., Dept. of Virology, *2007 I St. N.W., Washington, District of Columbia* 20006 (R01 CA 25419-02)

In this application we propose to evaluate an unusually high uterine cervical cancer incidence in the Republic of Panama. Panama not only has one of the highest reported cervical cancer rates in the world but also demonstrates marked geographic clustering and a shift in age specific incidence to women in the age group ranging from 20-39 years.

We plan to evaluate this by first recording all cervical cancer cases which occurred between 1974-1978 in a standardized national cancer register. We will then do a seroepidemiologic case-control study compering socioeconomic, sexual and herpes group virus risk factors which operate in cases and controls. In addition we plan to measure other variables which might account for the unique aspects of cervical cancer seen in Panama. Lastly we will evaluate the effects of the existing Pap smear program and collaborate in initiation of a more intensive screening program.

3.0641,

COLORECTAL CANCER AMONG CALIFORNIA MORMONS

L. Breslow, University of California, Los Angeles Campus, School of Public Health, Health Service & Hospital Administration, *405 Hilgard Ave., Los Angeles, California* 90024 (R26 CA 25157-02)

Based on our analysis of Church records, religiously active Mormon males in California and Utah compared with U.S. white males have standardized mortality ratio of 60% for colon cancer, 40% for rectum cancer, and 55% for colorectal cancer. Active Mormons abstain from tobacco, alcohol, and caffeine by Church prescription. However, the specific reasons for their low colorectal cancer rates are unknown.

The first objective is to pursue this descriptive mortality data with a prospective epidemiologic study of active California Mormon adults of both sexes. Using a questionnaire survey, demographic, lifestyle, dietary, occupational, and medical history data relevant to colorectal cancer etiology will be obtained on about 20,000 active Mormons, who will subsequently be followed for mortality over a four-year period. Furthermore, Church-based mortality rates covering the years 1960-67 and 1976-79 will be ascertained for all 350,000 California Mormons in order to supplement the existing rates for the years 1968-75. The questionnaire data on dietary and other lifestyle characteristics will be related to the colorectal cancer mortality rates. In addition to intra-Mormon comparisons, active Mormons as a whole will be compared with other California, U.S., and international populations which already have been studied with respect to colorectal cancer.

The second objective is to do a correlation analysis of extensive dietary and lifestyle data from the 1971-73 U.S. Health and Nutrition Examination Survey (HANES) with U.S. and California colorectal cancer mortality rates by country of birth and state of residence. Several etiologic variables of interest, including beef, fat, fiber, and beer consumption, will be examined for consistency with international correlations and previous epidemiologic findings. Special emphasis will focus on Spanish Americans born in Mexico, who have colorectal cancer death rates as low as those of active Mormons. The above analyses should yield new understanding of the etiology and prevention of large bowel cancer in the United States.

BIBLIOGRAPHIC REFERENCES: J. E. Enstrom: Health and dietary practices and cancer mortality among active California Mormons. Banbury Report No.4, Cold Spring Harbor Laboratory. (June 1980), in press. EXPLORATORY STUDIES OF CANCER PATIENT DATA CONTROL

S.J. Cutler, Georgetown University, School of Medicine, Dept. of Community & Family Medicine, *3800 Reservoir Rd. N.W., Washington, District of Columbia* 20007 (R10 CA 25146-03)

This application provides for support to enable the Epidemiology and Statistics Unit of the Georgetown University component of the Georgetown University-Howard University Comprehensive Cancer Center (the Vincent T. Lombardi Cancer Research Center), under the direction of Sidney J. Cutler, Sc.D., Professor, Department of Community and Family Medicine, further develop and maintain an effective computerized cancer information system and epidemiologic research program. The system, using codes, definitions, and procedures compatible with the Centralized Cancer Patient Data System, will help promote active collaboration between Georgetown University and Howard University and will be the basis for the development of a community-oriented epidemiological research program. Data on approximately 1,000 new cancer patients plus information on an additional 3,500 active cases are entered into the data base each year and utilized for analyses of patient characteristics, treatment and its end-results, and other descriptive reports. These analyses should provide clues on trends and patterns which warrant special studies, and any pertinent data will provide Georgetown Medical Center committees and the Cancer Coordinating Council of Metropolitan Washington means for implementing or changing cancer control programs or medical care policies.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $23,655

3.0643,

VARIATION IN CANCER PATIENT SURVIVAL BY RACE

Z.H. Bentwich, Kaplan Memorial Hospital, Dept. of Medicine & Clinical Immunology, *P.O.B. 1, Rehovot, Israel* (R01 CA 24418-03)

OBJECTIVES: Comparative study of survival of Gastrointestinal cancer patients in Israel, as a function of ethnic background, and immune response.

Israel has well defined ethnic populations differing genetically (HLA) as well as in cultural habits (diet, family size, use of health services). Marked differences in the incidence of GI cancer has been recorded between these populations, i.e. the incidence among East European Jews being much higher than that among Afro-Asian Jews. There is also a suggested difference in the fatality rate among these populations.

In the proposed study approximately 200 new GI cancer patients will be studied prospectively in the course of 4 years. Their survival according to their ethnic background will be determined and correlated with immune status during the course of the disease. The following immune parameters will be determined sequentially: a) General immune response - humoral response (serum Ig, antibodies to Fc and Fab, antinuclear antibodies, circulating immune complexes) and cellular immume response (mitogen response). b) Tumor immunity - 1) Leucocyte adherence inhibition (LAI) assay for tumor associated antigen. 2) CEA 3) Analysis of lymphoreticular cell infiltration around tumor cellular response to autologous tumor tissues.

In the analysis of the data, age, sex, stage and type of tumor will all be taken into consideration.

ENDOMETRIAL CANCER EPIDEMIOLOGY AND CONTROL

P. Greenwald, State Bureau of Cancer Control, *Empire State Plaza, Tower Bldg. Rm. 565, Albany, New York* 12237 (R01 CA 24367-03)

This epidemiologic study of endometrial cancer monitors the incidence, severity, and mortality trends in a sample of cases reported to the New York State Cancer Registry during the years 1971 through 1981. Cases will be validated through histologic re-examination and re-staging of this sample. This will indicate if incidence is increasing for both advanced and early stages of the disease, and what effect this may have on future mortality rates.

The epidemiologic case-control component of the research focuses on the association between endometrial cancer and the use of estrogens. Specifically, we wish to determine if estrogen use is associated with advanced stage disease, and if there is a risk decline following termination of use. Additionally, we will ascertain through multivariate methods the factors which discriminate low grade and/or early stage cases from high grade, advanced stage cases. One hundred and fifty advanced stage and 200 early stage newly diagnosed endometrial cancer patients will be interviewed. A case to control ratio of 1:2 for advanced stage cases and 1:1 for early stage cases will be used.

AN EPIDEMIOLOGIC STUDY OF CANCER OF THE OVARY

G.B. Hutchison, Harvard University, Boston Campus, School of Public Health, Dept. of Epidemiology, *55 Shattuck St., Boston, Massachusetts* 02115 (R01 CA 24209-02)

This epidemiologic study is designed to identify rsk factors for the several histologic types of ovarian cancer using caso-control methodology. Exposures of specific interest are occupation, diet, medical and reproductive history, and drug use, particularly oral contraceptives and estrogens for menopause. Our goal is to identify risk factors that primarily may be modified to reduce disease ocurrence or that secondarily may be of clinical usefulness in defining the woman at risk for ovarian cancer, to achieve better control of the course of the disease.

ENVIRONMENTAL EXPOSURES AND CHILDHOOD LEUKEMIA

T.W. Pendergrass, Childrens Orthopedic Hospital & Medical Center, Division of Hematology & Oncology, *4800 Sand Point Way N.E., Box C-5371, Seattle, Washington* 98105 (R23 CA 24186-03)

Little is known of the role of parental occupational exposures or perinatal drug ingestion in the subsequent development of childhood acute lymphocytic leukemia. This study has two goals: a) development of a method for obtaining information on parental occupational and perinatal drug exposures, and b) testing of this method on parents of children diagnosed as having acute lymphocytic leukemia, between 1972 and 1979, in the State of Washington. Cases have been identified in the three major hospitals treating children with cancer in the State. For each case a hospital control has been selected to attempt to control for any differences in recall between parents of ill and presumably well children. General population controls will be obtained by use of a random digit dialing method. To date, 80% of case parents have been interviewed. Occupational data include a detailed review of occupational history and review of each job-related exposure. A detailed review of perinatal drug ingestion is obtained.

CASE-CONTROL STUDY OF URINARY CANCER, COPENHAGEN

O.M. Jensen, Finseninstitutet, Danish Cancer Registry, *Strandboulevarden 49, DK2100 Copenhagen, Denmark* (R26 CA 24119-03)

Case-control studies of the aetiological role of occupational exposures, and personal habits including smoking, coffee-drinking and use of artifical sweeteners and analgesics by comparing cases of bladder cancer, cancer of the ureter and cancer of the renal pelvis with controls drawn from the general population as well as matched hospital controls for renal pelvis and ureteral cancer are ongoing. Relative risk estimates as well as attributable risks will be derived for each factor individually. The interaction between factors will be investigated.

The final study size will be some 550 cases of bladder cancer, 1100 group matched population controls, and some 150 ureter and pelvis carcinoma-cases to be compared with 450 age- and sex-matched hospital controls. Data collection is estimated to be finished by June 1981.

IMMUNOBLASTIC LYMPHADENOPATHY AND HISTIOCYTIC LYMPHOMA

R.K. Ross, University of Southern California, School of Medicine, Dept. of Family & Preventive Medicine/Pathology, *2025 Zonal Ave., Los Angeles, California* 90033 (R01 CA 24082-02S1)

We are studying the epidemiology of histiocytic lymphomas, and a possibly related disease entity, immunoblastic lymphadenopathy (IBL), in Los Angeles County. The study is designed to test for multiple antecedent risk factors for these diseases, with special emphasis on therapeutic agents previously implicated. The study is a two-part case-control study. The case group will consist of 100 cases of histiocytic lymphoma identified by the Los Angeles County/USC Center Surveillance Program, plus 50 cases of immunoblastic lymphadenopathy identified by the pathologic consulting service of Dr. Robert Lukes. Data will be obtained by interviews conducted by a trained nurse epidemiologist. Questionnaire information will focus on therapeutic history, environmental exposures at work and at home, allergic and other possible relevant past disease history, and family history of tumors. Medication history will be validated by contacting personal dentists and physicians of cases and controls.

In addition, venous blood specimens will be obtained on a group of IBL and histiocytic lymphoma cases and controls in order to help characterize the immune responses and assist in determining the affected cell types of these patients.

UCLA CANCER CONTROL DEVELOPMENTAL OUTREACH GRANT

J.W. Cullen, University of California, Los Angeles Campus, School of Medicine, Center for the Health Sciences, *2025 Zonal Ave., Los Angeles, California* 90024 (R18 CA 23974-03)

This is a renewal application for programmatic and administrative core support for the Division of Cancer Control, UCLA Jonsson Comprehensive Cancer Center. The specific aims and objectives of this grant focus on the planning, evaluation, administration and program maintenance needs of the Division in order to manage the Cancer Control Program of this Center. The objectives of the application are the following: 1. To demonstrate need for core support by describing programs/activities in selected cancer control intervention which require personnel and other core resources for implementation. 2. To secure the personnel necessary to continue the planning, development and implementation of cancer control programs in prevention, psychosocial rehabilitation, and professional and public education. 3. To establish evaluation and epidemiology core support services to assist in the planning, organization and implementation of all cancer control activities in the specific intervention areas noted above.

THERAPY-INDUCED GROWTH DISORDERS IN CHILDHOOD CANCER

S.C. Duck, Medical College of Wisconsin, School of Medicine, Dept. of Pediatrics, *561 N. 15th St., Milwaukee, Wisconsin* 53233 (R01 CA 23968-03)

Acute lymphocytic leukemia (ALL) is the most common malignancy of childhood. Currently about 50% of children diagnosed as having ALL will survive for 5 or more years. With improved survival times, many serious adverse effects of cancer therapy are being manifested: some of these are leucoencephalopathy, disrupted growth and development and neuroendocrine dysfunction. At present it is uncertain whether one can predict which children will experience these particular adverse effects and what if anything can be done to prevent expression of hormone dysfunction. The specific objectives are: 1. To establish if at any stage of therapy for ALL, there is an impairment of the neuroendocrine-endocrine end-organ axis, and to what extent such impairment is exposed clinically by disturbed growth and development. 2. To establish the relative 'necessity' and 'potential benefit' of appropriately timed trials of exogenous hormone therapy based on the temporal characteristics of these endocrine disruptions. Methods will involve four-year prospective evaluation of newly diagnosed children with ALL. The new patients will be enrolled during the first 2 years of the study, allowing 2-3 year follow-up for the survivors. Each patient will be evaluated by extensive, sequential anthropometric parameters, bone age analyses, and basal and 'stress'-released hormone levels, measured at each phase of cancer therapy.

A PROSPECTIVE COHORT FOR RISKS IN BREAST CANCER

F.E. Speizer, Harvard University, Boston Campus, Peter Bent Brigham Hospital, *721 Huntington Ave., Boston, Massachusetts* 02115 (R01 CA 23645-04)

This investigation is designed to follow prospectively a cohort of approximately 121,000 women, ages 30-54, in whom exposure to oral contraceptives, estrogens, cigarette smoking, and hair dyes has been documented. Morbidity and mortality for a variety of cancers including breast, endometrial, ovary, lung and others, as well as cardiovascular events, benign breast disease, and other benign obstetric and gynecologic events such as infertility and outcome of pregnancies will be followed. The approach is by mail questionnaire with further documentation of events by review of hospital records and pathologic specimen.

The cohort was defined from the register of Registered Nurses collected by the American Nurses' As-

sociation in 1972 and recorded at the time as being married women. Those women who on January 1, 1976 were between the ages of 30 - 54 and who responded to an inquiry in 1976 which collected - besides data mentioned above - information on menstrual history, height, weight, current contraceptive status and family history of myocardial infarction and breast cancer in female relatives constitute the cohort. In addition, an estimate of social class status at age 16, based upon parental occupations, was obtained. Personal past medical events related to cardiovascular, thromboembolic, benign and malignant breast disease, and other cancers were collected also. These variables will be used in multivariate models to define levels of risk of the above mentioned outcome events.

The 190 biennial assessment will add a detailed dietary evaluation as well as continue to collect outcome events.

IMMUNOPATHOLOGY OF THE X-LINKED LYMPHOPROLIFERATIVE SYNDROME

D.T. Purtilo, University of Massachusetts, Medical School at Worcester, School of Medicine, Dept. of Pathology, *55 Lake Ave. N., Worcester, Massachusetts* 01605 (R01 CA 23561-03)

Our objective is to study the immunopathology of the X-linked recessive lymphoproliferative syndrome (XLP) which is expressed phenotypically as diverse lymphoproliferative disorders: acquired agammaglobulinemia, fatal infectious mononucleosis, or malignant lymphoma. Three comprehensive approaches are proposed: (1) Development of a registry to ascertain the prevalence, delineation of phenotypic expressions, and development of diagnostic criteria. Cases will be ascertained by referrals and review of medical literature; cases in tumor registries and in pediatric and general hospitals will also be included. (2) Patients with the XLP will be evaluated for general immunocompetence using clinical, hematopathological and immunological and virological techniques. Blood, bone marrow, biopsy and autopsy specimens will be studied intensively using the above techniques. Males with XLP are probably immunodeficient to Epstein-Barr virus (EBV) and hence, we will test our hypothesis by demonstrating: a) spontaneous outgrowth of EBV-infected B cells in vitro; b) EBV shedding in saliva; c) failure to develop antibody to EBV; and d) abnormal autologous T cell responses to B cells infected by EBV in vitro. Testing is important diagnostically and could identify the immunopathogenetic mechanisms of the XLP. (3) Genetic screening for affected males with XLP and female carriers is being done by studying the Xga blood group and oculocutaneous markers, measuring general and EBV-specific immunocompetence, and detecting abnormal lymphocytes with heteroantisera raised to lymphocytes of patients and HLA-matched female siblings. Karyotyping of lymphoblastoid cell lines of patients will determine whether chromosomal breakage and marker chromosomes occur following infection by EBV in males with XLP. The development of a repository of their frozen sera, saliva and cultured lymphoblastoid cells for future studies is another objective of our study.

CASE-CONTROL STUDY OF MALIGNANT MELANOMA

A.K. Bahn, University of Pennsylvania, School of Medicine, Dept. of Research Medicine, *36th & Hamilton Walk, Philadelphia, Pennsylvania* 19174 (R01 CA 23544-02)

This is a two-year case-control study of 225 cases and matched controls resident in Northern New Jersey. All white males between the ages of 30 and 64 years in the selected counties with a diagnosis of malignant melanoma who were first diagnosed between July 1, 1978, and December 30, 1980, will be eligible as cases. Age-sex-race population matched controls will be selected.

Information obtained from records of private dermatopathology laboratories and hospital pathologist records will be used to determine cases aided by the New Jersey, New York and Pennsylvania cancer registers. All cases will be ascertained as malignant melanoma by a board certified dermatopathologist. Home interviewing of cases and controls will obtain information on: residence history, work exposure history (particularly to chemical substances), sun exposure, history of cancer in the family and history of chloracne dermatitis.

Preliminary work has provided suggestive evidence of a large relative risk of malignant melanoma among workers exposed to polychlorinated biphenyls (PCBs) and other chemicals. New Jersey has been selected as the locale for the study because this state has the largest number of workers in chemical and related industries in the nation and because high melanoma mortality rates (for an area outside the South) have been noted among males.

Investigation will be carried out to determine if there are significant differences between cases and controls in exposure to chemical substances, exposure to sunlight, or a previous history of chloracne dermatitis.

EPIDEMIOLOGY OF MYELOMA AND LYMPHOCYTIC LEUKEMIA

N.S. Weiss, Fred Hutchinson Cancer Research Center, Program in Epidemiology & Biostatistics, *1124 Columbia St., Seattle, Washington* 98104 (R01 CA 23350-02)

We propose a collaborative case-control study to identify and evaluate risk factors for multiple myeloma and chronic lymphocytic leukemia. Cases of these diseases will be identified through population-based cancer registries in Washington State, Utah, Detroit and Atlanta, over a three-year period. Control subjects will be identified from the general populations from which the cancer cases arose. Probability sampling methods, such as area sampling and random digit dialing, will be used for selection of controls. Cases and controls will be interviewed with particular attention to variables related to chronic antigenic stimulation e.g., past illnesses, allergies, drugs, etc. We will also obtain detailed residence and occupational information in an attempt to generate new etiologic hypotheses.

CANCER CONTROL DEVELOPMENT AND SUPPORT GRANT AT FOX CHASE

M.H. Donaldson, Fox Chase Cancer Center, *7701 Burholme Ave., Philadelphia, Pennsylvania* 19111 (R18 CA 23321-03)

The primary purpose of this proposal is to expand and strengthen the core resource capability of the Fox Chase Cancer Center to conduct and stabilize an effective program in cancer control. A model mechanism of a multidisciplinary team of health professionals with support from complementary professions - such as epidemiology, health education, biostatistics, health planning and communications - will be used to plan and conduct site specific demonstration projects on colo-rectal cancer and melanoma. Screening and early detection and targeted education projects will also be performed. Support is also requested to establish new developmental projects.

3.0656,

LUNG CANCER AND VITAMIN A

A. Lopez, Louisiana State University, Medical Center, School of Medicine, Dept. of Medicine, *1542 Tulane Ave., New Orleans, Louisiana* 70112 (R01 CA 23205-02)

The objective of this research project is to ascertain the relationship between vitamin A and lung cancer. This study is being carried out in Louisiana, a state known to have very high incidence of lung cancer. Preliminary analysis of available data (National Nutrition Surveys and HANES) indicates a negative correlation between beta-carotene (precursor of vitamin A) and mortality rates due to respiratory system cancers and also with mortality from all neoplasms, but not with total deaths. We have also initiated case control studies in which dietary intakes and vitamin A concentration in hepatic tissue of patients who died of lung cancer will be compared with those in appropriate controls. Studies have also been started in living patients suffering from lung cancer. Serum level concentrations and dietary intakes of vitamin A are measured and compared with those from matched controls. The information to be obtained from these studies would provide evidence for the suggested relationship between vitamin A (and/or other nutritional factors) and lung cancer.

STUDIES OF CHILDHOOD SOLID TUMORS

J.V. Simone, St. Jude Childrens Research Hospital, *332 N. Lauderdale St., P.O. Box 318, Memphis, Tennessee* 38101 (P01 CA 23099-03)

The overall objective of this project is to develop a coordinated effort to improve the results of treatment of children with solid tumors. This goal is to be achieved through the systematic development of specific treatment regimens for primary care of children with solid tumors as well as for the testing of new agents in Phase I and Phase II studies. In addition, there will be an attempt to develop an epidemiological approach to the children with cancer seen at St. Jude Hospital and also to develop a pharmacological approach to the altered drug pharmacokinetics in children with cancer. The goals set for the current year, the second in this project, are: 1) To develop a multidisciplinary approach to the treatment and evaluation of children with neuroblastoma. 2) To develop a multidisciplinary treatment program for children with osteosarcoma. 3) To plan and initiate an epidemiological program involving the solid tumor patients at St. Jude Hospital with special reference to the unusual occurrence of adenocarcinoma of the colon in childhood and adolescence in this region. 4) To investigate in animal systems and later in children with solid tumors the mechanism by which biotransformation of drugs is altered in experimental neoplasms and the relationship of this effect to polyamines. 5) To study the biological activity of new anticancer chemotherapeutic drugs in children with solid tumors using Phase I and Phase II type testing programs.

SECOND CANCERS IN PATIENTS WITH HODGKIN'S DISEASE

G.B. Hutchison, Harvard University, Boston Campus, School of Public Health, Dept. of Epidemiology, *55 Shattuck St., Boston, Massachusetts* 02115 (R01 CA 22849-04)

GENERAL OBJECTIVE: To determine the long-range hazard, in terms of carcinogenesis, of radiotherapy and chemotherapy used in treatment of Hodgkin's disease.

SPECIFIC AIMS: (1) To determine the incidence of second primary malignancies in patients treated with modern modalities for primary Hodgkin's disease. (2) To determine the variation in incidence of second primary malignancies by modality of therapy for pri-

mary Hodgkin's disease, comparing - (a) No intensive treatment; (b) Intensive radiotherapy alone: (c) Intensive chemotherapy alone; (d) Intensive both. (3) To determine the variation in incidence of second primary malignancies by specific drugs used in treatment of Hodgkin's disease. (4) To determine the variation in incidence of second primary malignancies by time since initiation of therapy for Hodgkin's disease. (5) To determine the distribution by organ site of second primary malignancies. (6) To determine the variation in incidence of second primary malignancies as in aims (1), (2), (3), and (4) above for all cancers, for leukemias only, and for all cancers other than leukemia.

METHODS: A cohort study is planned, using retrospective data on patients treated in 1940 to 1975 and followed to 1980 or death before 1980 and using prospective data on these same patients followed to 1984. Patients with Hodgkin's disease will be ascertained through registration records of large cancer therapy centers. The total study population will consist of 3000 patients (1500 diagnosed before 1970 and 1500 diagnosed in 1970-75).

CANCER AMONG HOUSEHOLD CONTACTS OF ASBESTOS WORKERS

H.A. Anderson, City University of New York, Mount Sinai School of Medicine, School of Medicine, Dept. of Community Medicine, *1 Gustave L. Levy Pl., New York, New York* 10029 (R01 CA 22792-03)

The increased cancer risk (lung, pleural, mesothelioma and colon) associated with direct occupational exposure to asbestos has been well documented. Growing evidence of an increasing prevalence of asbestos associated disease among 'bystanders' (non-asbestos trade employees working in close proximity to asbestos workers) is being described. Concern has been extended to members of asbestos worker households (over 70 mesotheliomas reported in the literature). The current study will be the first to systematically examine the mortality experience of a well defined cohort of household members of amosite asbestos workers. During Year I, cohort workers were identified utilizing pre-existing records. Year II has been spent tracing the cohort and establishing vital status. The cohort now contains 2,205 members; all but 511 (23%) have had their vital status determined. Of 1,694 whose status has been updated, 1,164 are known alive and 620 deceased. Death certificates are being gathered and 553 have been obtained. Available information has been transcribed onto computer readable cards. Where death certificates indicate that death occurred in a hospital, and especially for those on whom a post-mortem was performed, written permission has been sought to acquire this information. Identification, tracing and updating of the cohort is proceeding as scheduled and is expected to reach 95% of the cohort.

The information from this study, when combined with the experience of index workers who have been occupationally exposed to the same fiber, from the same source, in the same years and geographical location, will make it possible to establish risk levels for these various asbestos exposures. It should also indicate whether the risk of household asbestos exposure warrants consideration by government, labor and industry and any proposed for surveillance of asbestos exposed individuals.

BIOMATHEMATICAL APPROACHES TO CANCER

A.G. Knudson, Inst. for Cancer Research, *7701 Burholme Ave., Philadelphia, Pennsylvania* 19111 (R01 CA 22780-03)

This is a multi-investigator project that applies mathematical and statistical methods to the etiology of cancer and to the elucidation of biological mechanisms relevant to cancer biology. (1) Data on experimental cancers and on the incidences of various human cancers are being compared with mathematical models that allow for growth of stem cells and the occurrence of two or more critical cancer mutations. (2) Selected international populations are being investigated for the development of hepatic cancer following infection with hepatitis B virus. Immune responses are monitored and the roles of congenital viral infection, nutritional status, and serum iron and ferritin levels evaluated. (3) Linear discriminant analysis is applied to data on the age-specific incidences of cancers of various kinds in rats as a function of early nutritional history with the objective of discovering diets conducive to reduction in risk of neoplasia. (4) The interactions of carcinogens with nucleic acids of enzymes with substrates and metals, and of proteins with drugs are being studied by X-ray crystallography and NMR spectroscopy. Theoretical molecular models are built and 3-dimensional representations displayed graphically. (5) Mathematical programs are being developed to permit the calculation of the number of molecules of a particular RNA species at a given time following viral infection and to facilitate the analysis of viral nucleotide sequence information. (6) Stochastic models are being developed for the study of antibody diversity, the analysis of family clusters, the mechanism of bacteriophage attachment, and the analysis of RNA processing during development. (7) The thermodynamic theory of fluctuations is being applied to epigenetic variation in cell biology. (8) The growth of cells in culture is being simulated by computer in order to interpret data on cell cycles. (9) New methods are being developed for the analysis of clinical research data.

A PILOT DEMONSTRATION DETECTION PROGRAM

V.F. Greco, Community Cancer Corp. of Luzerne County, *Box 1345, Wilkes Barre, Pennsylvania* 18703 (R18 CA 22190-03)

This pilot detection program is the first effort in implementing cancer control plan, begun by area physicians several years ago and supported in part by a Cancer Center Planning Grant. The pilot proposes to use specially trained nurse clinicians to perform screening tests and examinations in Luzerne County, Pennsylvania. During the three-year program, nurses, recruited from the community and trained at Hahnemann Oncologic Institute, will perform complete screening examinations in two hospital-based clinics. A projected population of 10,944 people over the age of 40 will be screened for cancer of the mouth, throat, cervix, prostate, breast, skin, and rectum.

Demonstration pilot efforts include the training and utilization of nurse clinicians in this unique fashion, study of variables in patient participation, acceptance of nurse clinicians by both patients and physicians, examination of the validity and reliability of this form of community based cancer screening, analysis of cost variables and the progressive development of programmatic self-support by the community. The pilot is further designed to encourage the introduction of a single county tumor registry and to encourage additional epidemiologic research in future years although funds are not requested for these purposes here.

The applicant is the Community Cancer Corporation of Luzerne County (CCC), a new non-profit corporation which has been created to plan and manage this and other cancer related service projects. The corporation and indeed this pilot request are an outgrowth of the extremely high incidence of cancer in the county, the high degree of physician and community support for the project and the potential applicability of the pilot to other similar regions of the country.

3.0663,

THE EPIDEMIOLOGY OF MULTIPLE MYELOMA

S. Grufferman, Duke University, School of Medicine, Dept. of Community Health Science/Pediatrics, *Box 3711, Durham, North Carolina* 27710 (R01 CA 22104-04)

The major objective of this case-control study is to learn more about the epidemiology of multiple myeloma (MM). Surprisingly little is known about the epidemiology of MM, available information is dated, and there are few etiologic hypotheses. To our knowledge, this will be the first case-control study specifically involving MM cases.

The study will have 2 major components, a medical record review of 450 MM cases and an interview study of an additional 150 MM patients, both components involving matched hospital controls. In addition to seeking associations with available demographic variables, associations between MM and socioeconomic class (S-E), occupation, environmental exposures, diet, and diseases causing 'immune stimulation' will be evaluated. Particular attention will be paid to evaluation of the association between S-E class and MM. Paradoxically, MM is reported as being positively associated with high S-E class whereas incidence rates are twice as high in blacks as in whites.

STUDIES OF OCCUPATIONAL CANCER

A.E. Blair, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Occupational Studies Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04480-04 EEB)

This project involves identification of cancer patterns among occupational groups that may reflect exposures in the work environment and investigation of methodological issues in occupational studies. Study groups are selected because of 1) known or potential exposure to established or suspect carcinogens, 2) prior reports suggesting an unusual cancer experience for the group, 3) requests by outside institutions, and 4) availability of useful resources. Resources used included employment and death records maintained by companies, labor unions or professional organizations, and records from government agencies. Studies during the past year include cohort mortality studies of persons employed in dry cleaning, non-agricultural pest control, chemical plants, non-ferrous smelters, taconite mines, jewelry manufacturing, embalming, welding, shipyards, chemical and medical laboratories, ship inspection, and hematite mining. Proportionate mortality studies being conducted involve tobacco workers, petrochemical workers, pottery workers, fur dyers, veterinarians, and embalmers. Death certificates are used to investigate occupational origins of leukemia, Hodgkin's disease, non-Hodgkin's lymphoma, multiple myeloma, and cancers of the prostate and colon.

3.0666,
METHODOLOGIC STUDIES IN EPIDEMIOLOGY

W.J. Blot, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Analytical Studies Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04500-03-EEB)

The objectives of this project are to develop, adapt, expand, and evaluate methodological procedures useful in epidemiologic studies of cancer. Methods of design and analysis of epidemiologic studies were given particular emphasis with attention focusing on the adaptation and evaluation of multivariate logistic models for analysis of case-control data. Investigation of general epidemiologic techniques for studying environmental cancer continued, including publication of a text and series of papers on biostatistical methods and review of methods to evaluate the magnitude of low-dose radiation risks.

3.0667,
STUDIES ON CANCER PATIENT DATA CONTROL

S.H. Walker, Colorado Regional Cancer Center Inc., Division of Epidemiology & Statistics, *1655 Lafayette St., Suite 301, Denver, Colorado* 80218 (R10 CA 21878-04)

The objective of this proposal is to implement an operational plan and mechanisms for the Colorado Regional Cancer Center Data Control System to include standardized input of statistical data, computerized processing, quality control procedures, statistical analysis, and reporting. The Data Control System will facilitate evaluation of Cancer Center activities, provide the capability of sharing data with other Cancer Centers, and support epidemiological and clinical research activities in institutions affiliated with the Colorado Regional Cancer Center, Inc. Activities will support the establishment of the 'Statistical Data Base of a Comprehensive Cancer Center' as specified in objectives established by the National Cancer Advisory Board for the Cancer Centers Program. A model computerized tumor registry will be developed in the University of Colorado Hospital to include on-line data entry and editing and computer generation of reports. Methods and procedures developed and implemented will be transportable to other institutions. Assessing patient load, referral and survival patterns, incidence and etiology of various neoplasms, and effectiveness of treatment programs in numerous institutions will be facilitated by implementation of the Data Control System.

BIBLIOGRAPHIC REFERENCES: Franz, L.W., Ferguson, S.W., Sutherland, J.V., Berg, J.W. and Walker, S.H. (1978) Cancer in Colorado. American Cancer Society, Colorado Affiliate, March 1978. In press.

3.0668,
RADIATION-INDUCED THYROID CANCER

A.B. Schneider, University of Chicago, Michael Reese Hospital & Medical Center, Dept. of Medicine, *2929 S. Ellis Ave., Chicago, Illinois* 60616 (R01 CA 21518-05)

The major objective of this research proposal is to study radiation-induced thyroid cancer by a coordinated program of clinical and basic endocrinological investigations. The clinical studies are designed to determine the current risk and continuing incidence of radiation-induced thyroid cancer and to evaluate methods of diagnosis and medical and surgical approaches to treatment. This will be accomplished by a longitudinal study of patients who have been evaluated at Michael Reese Hospital because of a history of childhood head and neck irradiation. Of 5,200 patients who were so treated, 1,700 have been examined and another 1,400 have been contacted. In this population there is a 32 percent prevalence of nodules and among those who have had surgery 36 percent have had thyroid cancer. Follow-up examination of patients who were initially normal will provide an estimate of the continuing incidence of radiation-induced thyroid cancer. Follow-up examination of patients who were initially abnormal will provide an evaluation of the various methods of treatment which have been used. Together these will provide the information necessary to develop clinical guidelines for the care of persons with a history of head or neck irradiation.

Laboratory studies will focus on the role of serum thyroglobulin in the diagnosis of thyroid tumors. Plasma thyroglobulin is elevated in majority of patients with thyroid nodules and in 12 percent of patients who have a history of irradiation but who otherwise appear completely normal. This project will determine whether an elevated thyroglobulin level indicates an especially high risk for the formation of thyroid nodules and study the role of serum thyroglobulin measurements in managing patients with thyroid cancer.

Detailed studies of the molecular properties of serum thyroglobulin using physical-chemical methods will continue in order to improve its diagnostic usefulness and to understand how it enters the circulation. The mechanisms controlling thyroglobulin synthesis and secretion will be studied by perfusion of isolated thyroid cells and follicles. The Wollman transplantable thyroid tumor line 1-1C2 will be used as a model system to study plasma thyroglobulin and thyroid cancer.

A CANCER CENTER PATIENT DATA SYSTEM

M.D. Keller, Ohio State University, Columbus Campus, School of Medicine, Dept. of Preventive Medicine, *370 W. 9th Ave., Columbus, Ohio* 43212 (R10 CA 21751-04)

This application is submitted in support of the Epidemiology and Biostatistics Unit of the OSU Comprehensive Cancer Center (OSUCCC). The Epi-Stat Unit is responsible for OSUCCC's participation in the Centralized Cancer Patient Data System (CCPDS). Development of the University Hospitals Tumor Registry will continue in accordance with the data collection and analysis procedures recommended by the CCPDS program. In addition, epidemiologic and biostatistical studies will be conducted utilizing the CCPDS and other relevant data bases described in this proposal. The data system will be expanded to meet regional and national needs through collaboration with other tumor registries in Ohio and with other Comprehensive Cancer Centers.

3.0670,
ENVIRONMENTAL EPIDEMIOLOGIC STUDY OF PANCREATIC CANCER

L. Gordis, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (R26 CA 21642-03S1)

Since pancreatic cancer is now the fourth leading cause of cancer death in the United States, intensive efforts are needed to reduce the impact of this disease. In view of the rapid clinical course of pancreatic cancer and the grim prognosis, it is likely that the greatest hope for progress in treatment of this disease will be through prevention and early detection. A three-part environmental epidemiologic study of pancreatic cancer is therefore proposed to identify specific risk factors and possible etiologic agents and mechanisms. The first phase will describe the changing incidence and mortality rates of pancreatic cancer over a 15 year period in a defined community, metropolitan Baltimore. The second phase of this study will be a case-control investigation of pancreatic cancer patients and various control groups to explore possible etiologic factors; in particular, environmental and occupational characteristics including exposure to chemical agents and to health care environments and occupations. In addition, younger and older cases will be compared with respect to these characteristics, to determine whether pancreatic cancer in the young is the same as in the elderly. Finally, a non-concurrent prospective study will be carried out to determine whether the risk of developing or dying from pancreatic cancer is higher in patients with chronic pancreatitis than in a non-pancreatitis control group. The approaches outlined above are designed to provide the basis for modifying environmental exposures and thus developing measures for preventing the disease. Secondly, the results may permit the identification of populations which are at high risk of the disease who might benefit from close medical surveillance and intensive efforts at early detection using the newer diagnostic techniques currently being developed.

STUDIES OF RADIATION-INDUCED CANCER

C.E. Land, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Radiation Studies Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04481-04-EEB)

The objective of this project is to examine cancer incidence and mortality among populations exposed to ionizing and non-ionizing radiation, especially low-dose levels. As pressure mounted to identify the health effects of low-level radiation, a Radiation Studies Section was organized and large-scale studies of irradiated populations initiated. Groups studied include 80,000 Japanese A-bomb survivors, over 100,000 cervical cancer patients treated with radium implants, 20,000 former tuberculosis patients who received multiple chest fluoroscopies, 3,500 children exposed to head and neck irradiation, other patients exposed to diagnostic and therapeutic radiation, workers with histories of occupational exposures to radiation, and the populations of SEER reporting areas with different levels of solar UV radiation. In addition, project members have served on committees and task forces of DHEW, EPA, DOE, NIH, and NCI formulating government responses to current problems associated with health effects of ionizing radiation.

FIELD STUDIES IN HIGH-RISK AREAS

W.J. Blot, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Analytical Studies Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04779-04-EEB)

The objectives of this project are to identify and describe environmental and host determinants of cancer in areas of the U.S. at high risk of cancer through the use of analytical epidemiologic techniques, particularly case-control studies of specific cancers. Completed during the year were interview studies of (a) respiratory tumors in Tidewater, Virginia, which showed a 70% smoking-adjusted excess of

lung cancer and a 1500% increase of mesothelioma associated with employment, primarily during World War II, in area shipyards; (b) esophageal cancer among black males in Washington, D.C., which revealed a dominating effect of alcohol consumption, although other interesting nutritional differences were also uncovered; and (c) colorectal cancer in rural Nebraska which identified an increased risk among persons of Czechoslovakian descent and a familial clustering. Also completed was death certificate review of lung and pancreatic cancer in Louisiana; results indicated an excess of petroleum industry occupations associated with both of the cancers and shipbuilding employment associated with lung cancer and a higher frequency of lung cancer among the older Acadian (Cajun) minority.

3.0674,

SPECIAL NON-MELANOMA SKIN CANCER INCIDENCE SURVEY AND EPIDEMIOLOGY STUDY

J. Scotto, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Biometry Branch, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04475-04-B)

This project, a collaborative effort by the NCI, EPA and other federal agencies, was initiated to provide more data relative to skin cancer and harmful solar ultraviolet. An urgent need for these data has existed since recent scientific reports have warned about the decomposition of stratospheric ozone by nitrogen oxides and chlorofluoromethanes (CFMs). Federal regulatory agencies have already recommended bans on the use of aerosol spray cans which use CFMs as propellants. In the near future, there will be critical reviews of all pertinent information by government as well as individual interests concerned with the threat of increased human skin cancer due to excess amounts of UV-B reaching the earth's surface, as its protective ozone shield is depleted. As mandated by Public Law 95-95 (amendment to the Clean Air Act of 1977), the NCI will continue its investigations by adding 2 new locations to its data bases during this fiscal year. This will provide more reliable national estimates of the degree of morbidity from nonmelanoma skin cancer as well as epidemiologic data on host and environmental factors, other than solar ultraviolet, associated with increased risk. New leads from 8 surveys just being completed will be pursued in two new surveys being implemented.

IMMUNOLOGIC FACTORS IN CANCER ETIOLOGY

R.N. Hoover, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Environmental Studies Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04401-04-EEB)

The purpose of this project is to identify and study populations with altered immunologic states experiencing unusual rates of malignancy. Risks of cancer of different sites are quantified for various groups of such patients, compared with each other, and characteristics and possible determinants of unusual risks are sought. The populations studies include renal transplant recipients, patients with inherited and acquired immune deficiency syndromes, groups of immune-stimulated persons (e.g., hyperimmunized, autoimmune syndromes) and patients experiencing conditions for which sequelae related to immunity are suspect but unknown (e.g., splenectomy patients). Both cohort studies of these groups of patients and case-control studies of such patients who also developed cancer are conducted.

FAMILIAL, CONGENITAL AND GENETIC FACTORS IN MALIGNANCY

J.J. Mulvihill, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Field Studies & Statistics Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 CP 04377-09 CEB)

Study of genetic diseases with neoplastic manifestations and detailed investigation of families with high risk of cancer may help detect environmental and genetic influences in carcinogenesis, especially when appropriate laboratory assays are used.

Besides results from our Clinical Studies Section and the Family Studies Unit of the Environmental Epidemiology Branch, laboratory reports were made on abnormal lymphocyte responses in four families with malignant melanoma complicating BK mole syndrome, an excess frequency of HLABw35 in 13 Hodgkin's disease families, and in vitro radiosensitivities in a family with acute myelogenous leukemia and a radiogenic rectal carcinoma. A monograph on neurofibromatosis was edited and a collaborative NIH clinical-laboratory investigation of neurofibromatosis begun. Various groups of patients who survived cancer were studied for reproductive performance. Syndromes that do or may predispose to cancer were discovered or further delineated. Various methods to stimulate similar research were used including guest lectures, literature reviews, and participation in committee activities.

U.S. CANCER MORTALITY SURVEY

T.J. Mason, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Population Studies Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04378-05-EEB)

The objective of this study is to examine the cancer mortality experience in the United States relative to cancer etiology. Special emphasis is placed upon the selection of areas in the U.S. for intensive study. Publications from this area of interest have facilitated the design of ongoing analytical investigation to test specific etiologic hypotheses. Possible prenatal origins of childhood cancer are being investigated by focusing on potential exposures realized by the pregnant mother. The rising rates of myeloma in blacks suggest genetic and environmental factors that need to be tested in analytic epidemiologic studies. Analysis of non-Hodgkin's lymphoma at the county level for 1950-1975 detected associations with higher social class and also large percentages of residents of Russian and Greek descent. Changes in age-specific rates for breast cancer appear related to the changing patterns of childbearing among young adult women of the first two-thirds of this century. Analyses of changing patterns in the rates of thyroid cancer in Connecticut detected findings consistent with the use of radiation therapy from the early 1920's to the late 1950's.

STUDIES OF CANCER INCIDENCE AND MORTALITY AND RELATED ETIOLOGIC FACTORS

E.S. Pollack, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Biometry Branch, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 CP 04258-12 B)

During the past year, research on stomach cancer and precursor lesions continued in Japan, Hawaii and Colombia. Research also continued on colorectal cancer in these same areas. The Norwegian migrants studies are continuing and a concerted effort is beng made to analyze large sets of data in Minnesota and Norway which is expected to produce more useful information on important dietary factors related to gastrointestinal cancers. Cancer mortality among Chinese in the United States is being studied. Groups in California, Hawaii and New York City constitute about 70% of the U.S. Chinese population. Comparisons with Chinese in Taiwan have been planned. The mortality experience of Chinatowners in New York City and San Franciso has been compared with that of the general Chinese population. Another study is in progress on selected indications on health and major causes of death in the People's Republic of China.

CONSULTATION ON CLINICAL TRIALS

D.P. Byar, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Clinical & Diagnostic Trials Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 CP 04260-20 B)

The purpose of this project is to provide consultative services in statistical and epidemiological methodology in the design, interpretation, and evaluation of clinical trials and other studies requiring this kind of expertise. For some trials the section provides full statistical support including development of detailed study plans, randomization of patients, collection, processing, editing, and analysis of data, and preparation of scientific papers. At present, members of the Section are involved in studies concerned with prostate cancer, testis cancer, breast cancer, lung cancer, brain tumors, and mycosis fungoides. In addition to these major projects, a variety of other consultative activities, including review of scientific articles, arise in response to special requests.

STUDIES OF THERAPEUTIC END RESULTS AND PROGNOSTIC FACTORS

M.H. Myers, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Biometric Research & Analytic Studies Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 CP 04257-23 B)

Among white cancer patients significant increases in survival over the 10 year span from 1960-63 to 1970-73 were observed for 7 of the 10 most frequently occurring cancers (Lung, Stomach and Pancreas were the exceptions). Among black patients significant increases were noted for cancers of the uterine corpus, uterine cervix, urinary Bladder and prostate. The most remarkable improvements in survival were observed for Acute Lymphocytic Leukemia in Children less than 15. A newly developed age-dependent mathematical model for cancer screening has lead to a more complete understanding of length bias than had previously been possible. Women with lobular carcinoma in situ are at an increased risk of developing subsequent contralateral carcinoma. No elevated risk was observed for intraductal carcinoma. Cervical cancer patients treated by radiotherapy are at an increased risk of developing leukemia and cancers of the lung, bladder, kidney and genital organs. Adjustment of black-white differences in incidence of breast and cervical cancer for socioeconomic levels explained substantial portions of the observed differences for each site. A statistical method utilizing the interval of time between successive diagnoses of cancers has application in monitor-

ing time trends of cancer incidence and for assessment of disease clustering.

ESTROGENS AND GENITAL ANOMALIES AND CANCER IN OFFSPRING
R.H. Kaufman, Baylor College of Medicine, School of Medicine, Dept. of Obstetrics & Gynecology, *1200 Moursund Ave., Houston, Texas* 77025
OBJECTIVE: Identify and study offspring of women who received synthetic estrogens during pregnancy between 1943 and 1963. Repeat examinations at regular intervals, perform diagnosis and follow-up and treatment as necessary. Approximately 1,000 offspring are to be examined on this contract.
PROPOSED COURSE: The contractor will establish standard definition of eligibles and develop suitable approaches to elicit eligibles through information campaigns directed at physicians and the general public via mass media. Evaluation will be performed and reported.
PROGRESS: A total of 548 participants had been entered by March 1976. Of these, 519 are active participants, with 446 having documentation of DES exposure in utero. Chart reviewing by physicians in the Houston area has been the primary source of participants. Also, the health services at local universities have been used as an outreach to women students. Consent forms have been utilized.

SUPPORT SERVICES FOR FIELD STUDIES
A. Toledo, Westat Inc., Research Division, *11600 Nebel St., Rockville, Maryland* 20852
The Epidemiology Branch of the National Cancer Institue conducts studies to define the distribution and determinants of cancer in man. The objectives of this contract are to provide technical (non-professional), mamagerial, and clerical support for the field studies directed by the Epidemiology Branch. The contractor will function in purely supportive role, carrying out specific tasks, whenever requested, anywhere within the United States.

3.0689,
EPIDEMIOLOGY OF MEDULLARY AND LOBULAR BREAST CANCER
P.P. Rosen, Memorial Sloan Kettering Cancer Center, *1275 York Ave., New York, New York* 10021
The primary objective is to compare risk factors for the less common histologic types of breast cancer, such as lobular and medullary cancers with the more common infiltrating ductal types which comprise approximately 80% of breast cancers in the United States. Preliminary epidemiologic data is suggesting that the less common types of breast cancer may havesome epidemiologic characteristics of their own. Although lobular and medullary breast cancers are relatively rate, it is conceivable they may fit into epidemiologically definable patterns.
SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $18,069

3.0690,
EPIDEMIOLOGY OF PRE- AND POST-MENOPAUSAL BREAST CANCER
D.C. Deubner, Duke University, School of Medicine, Dept. of Community & Family Medicine, *Box 3711, Durham, North Carolina* 27710
This study consists of 400 breast cancer patients undergoing surgery at hospitals, 800 age-race matched surgical, medical, or family practice patients not having breast or gynecological surgery at the same hospitals, and 1800 subjectsfrom the community. Data collection is by interviews and review of hospital charts. Laboratory studies on tissue and serum from patients will include quantitative estrogen and progesterone receptor determinations, evaluation of histologyand progesterone standardized protocol, and estrogen and progesterone serum determinations. Statistical analyses will estimate the relative strength of association between breast cancer in pre- and post-menopausal women and such factors as age of menarche, first delivery, obesity, and family history of breast cancer. Associations between risk factors andtumor cell biology and morphology will be sought by comparing the laboratory results in women with and without single ormultiple risk factors.

SEROEPIDEMIOLOGICAL STUDIES ON NASOPHARYNGEAL CARCINOMA AND BURKITT'S LYMPHOMA
C.A. Linsell, Centre International de Recherche sur le Cancer, *150 Cours Albert Thomas, 69372 Lyon Cedex 2, France*
SCOPE: Research activities aimed at studying the association between EBV, Burkitt's lymphoma and NPC.
Results will be helpful in defining the viral etiology of various types of human cancer and in defining approaches for this control.
The studies under this contract are being developed as three projects: 1. The prospective study in Africa (Uganda) to determine the serological status of African children in relation to EBV. 2. The epidemiology of EBV in different population groups. 3. Studies on the etiology of nasopharyngeal carcinoma.

SAN FRANCISCO RESOURCE FOR CANCER EPIDEMIOLOGY
D.F. Austin, State Health & Welfare Agency, *915 Capitol Mall, Room 200, Sacramento, California* 95814
Maintain a cancer reporting system in the five counties of the San Francisco-Oakland metropolitan area. The system will utilize standardized abstracts of records on all cancer patients seen in the 75 hospitals in the area as well as for all five-county area resident patients who are diagnosed or treated in hospitals in other areas for active cancer. All death certificates of residents dying in the area or outside the area where cancer is mentioned on the death certificate as well as the death certificate of any case listed in the registry will be abstracted. Records of private laboratories and radiotherapy units will be utilized in order to insure complete coverage of cases. Records of nursing homes which provide the services of diagnostic physicians and/or laboratories to patients will also be utilized. Reporting and data processing procedures are to be maintained so as to produce valid incidence rates within eleven months after the end of each calendar year.

EPIDEMIOLOGY OF BENIGN BREAST DISEASE

G.H. Spivey, University of California, Los Angeles Campus, School of Public Health, Dept. of Epidemiology, *405 Hilgard Ave., Los Angeles, California* 90024

Esamine the epidemiology of major types of benign breast disease and compare identifiable risk factors for benign diseases with those for breast cancer. Examine a recently developed histologic classification scheme based on grading of cellular atypia comparison to the commonly used histopathologic scheme.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $62,800

3.0695,

CANCER AND RELATED CONDITIONS IN DOMESTIC ANIMALS - EPIDEMIOLOGIC COMPARISONS WITH MAN

H.M. Hayes, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Environmental Studies Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04411-04-EEB)

The continuing purpose of this project is to identify animal models applicable to further research into the etiology of cancer in humans. Additionally, as cases accumulate, the probability increases that domestic pets with some types of spontaneous cancers can be identified as representing the effects of low level environmental exposure to carcinogenic agents. The frequency of cancer in these animals would serve as a warning of general environmental hazards to man. The topics of current interest include: 1) Environmentally influenced cancer in dogs relative to the level of industrialization in their county of residence; 2) the epidemiologic features of splenic neoplasms, gastrointestinal cancer, colo-rectal cancer, and prostatic cancer in dogs; 3) a case-control study of the long-term effects of Promone in dogs; 4) morbidity among military working dogs compared to that in pet German shepherds.

STUDIES OF CANCER-PRONE FAMILIES

W.A. Blattner, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst., Environmental Epidemiology Branch, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01-CP-04410-04-EEB)

The purpose of this project is to conduct and coordinate interdisciplinary studies on cancer-prone families in order to clarify the role of genetic mechanisms and host-environmental interactions in carcinogenesis. Clinical studies of high-risk families have suggested etiologic relationships between cancers, constellations of which may cluster in individuals (multiple primary neoplasms) or may be scattered over the family tree (familial neoplastic syndromes). Discovery of laboratory test abnormalities in certain cancer-prone families, such as subclinical immune dysfunction in family members predisposed to lymphoma, melanoma, and some gastrointestinal malignancies, immunogenetic determinants in acute leukemia, Hodgkin's disease, and Waldenstrom's macroglobulinemia, DNA repair defects in leukemia and other familial neoplasm syndromes, metabolic defects in bladder cancer-prone families, and clinically apparent premalignant conditions in individuals prone to colon cancer and melanoma, have provided insights into the mechanisms of susceptibility to cancer.

EPIDEMIOLOGICAL INVESTIGATION OF CANCER IN UTAH

J.L. Lyon, Utah Higher Education System, University of Utah, School of Medicine, Dept. of Surgery, *1400 E. 2nd S., Salt Lake City, Utah* 84112

Patient follow-ip after diagnosis and treatmetn has been a major objectiv e of teh registry since its beginning in 1966. Information is collected from hosptials, physicisans, pathology laboratories, radiotherapy centers and the Utah State Division of Health and is processed quarterly by computer. If a patient has not been seen by a physician within one year, the computer will generate a follow-up letter to be sent to the responsible physician. The registry has accessioned over 33,000 cases, approximately half of which are alive and being followed. About 2,000 cases are registered each year from Utah and another 2,000 from the neighboring states of Nevada, Idaho, Montana, Wyoming other states are processed separately and the registry is paid $1.50 per case for this service. Reporting is not compleservice. Reporting is not complete in these stes so no incidence data are available.

EPIDEMIOLOGICAL STUDIES

S. Jablon, National Academy of Sciences, *2101 Constitution Ave. N.W., Washington, District of Columbia* 20037

The objective of this project is to develop and conduct a cancer epidemiology program designed to make efficient use of the military-veteran population, utilizing medical, demographic and environmental observations made at entry and during military service, and the subsequent medical history of veterals ascertained through facilities of the Veterans Administration supplemented by mortality data. The Field Studies and Statistics Program is concerned with studies to identify and clarify each etiologic factor in cancer. Work will include a study of Hodgkin's Disease, childhood cancer as it relates to prenatal x-ray, and follow-up of World War II Veterans with certain conditions possibly related to cancer (splenectomy, allergy, orchidopexy, nephrectomy, and alcoholism).

SURVEILLANCE OF HEALTH EFFECTS OF POTENTIALLY LESS HAZARDOUS CIGARETTES

G.D. Friedman, Kaiser Foundation Research Inst., *4900 Sunset Blvd., Los Angeles, California* 90027

OBJECTIVES: This is a prospective epidemiologic study designed to investigate the health effects of smoking, with a particular focus on recently introduced smoking products with reduced yields of selected toxic constituents. Hypotheses are to be tested regarding significant differences between health effects of the older and newer smoking products.

A self-administered questionnaire will be completed by all Kaiser health plan subjects who are given a multiphasic health checkup (MHC) at the KFRI Oakland-San Francisco facilities during a two-year period (March 1979 - February 1981). It is expected that approximately 50,000 subjects will be involved annually. The questionnaire contains detailed questions on smoking habits, as well as more general questions on occupation, demographic-socioeconomic characteristics, and dietary practices. Questionnaire responses, in conjunction with mortality and morbidity data (hospitalization stays, physician visits, days of incapacitation) and MHC data, are to be analyzed for relationships between smoking habits and adverse health effects.

This study is planned initially to cover a three-year period (two years of data collection, one year for follow-up and analysis).

MAJOR FINDINGS: Since this study has just begun, there are no findings to report at this time.

SIGNIFICANCE TO BIOMEDICAL RESEARCH AND THE PROGRAM OF THE INSTITUTE: This study addresses two Smoking and Health Program goals: Identification of individuals at high risk to tobacco-related diseases and identification of the toxic constituents of smoking products.

PROPOSED COURSE: Since this is a new effort, it is anticipated that it will be continued for three years in order to accomplish objectives.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. funds n.a.

3.0709,

CASE CONTROL STUDY OF LUNG CANCER IN CUBAN MEN AND WOMEN

O. Joly, Centre International de Recherche sur le Cancer, *150 Cours Albert Thomas, 69372 Lyon Cedex 2, France*

OBJECTIVES: Cuban women have the highest reported incidence of lung cancer of all comparable groups in the Americas (World Health Statistics Annual, 1973); Cuban men have the third highest rates. This study is intended to indentify specific factors associated with these high rates.

The study is similar to the U.S. and Western European case-control studies sponsored by the Smoking and Health Program, with three major differences: the Cuban questionnaire covers reproductive history as well as the topics covered by the other studies; one of the matched controls is a neighborhood resident, as contrasted to both controls being hospitalized patients; and initially the Cuban study was restricted to female respondents. However, male as well as female subjects are now being interviewed. Of primary interest in this study is the investigation of tobacco type (light and dark) associated with lung cancer development. Hypotheses regarding the role that light and/or dark tobacco type plays in the unusually high lung cancer rates will be tested. In addition, data from this study will be compared to data from the U.S. and Western European case-control studies to increase and substantiate our understanding of the association between smoking and lung cancer.

MAJOR FINDINGS: The data accumulated thus far are insufficient to provide meaningful results.

SIGNIFICANCE TO BIOMEDICAL RESEARCH AND THE PROGRAM OF THE INSTITUTE: The results of this study will be compared to those obtained from other Smoking and Health Program case-control studies to clarify the role of smoking usage and other factors in the development of lung cancer. These studies directly address two of the principal Smoking and Health Program objectives: to identify individuals at high risk to tobacco-related diseases, and provide information for possible use by others in developing less hazardous cigarettes.

PROPOSED COURSE: It is anticipated that this effort will be completed in one year.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. funds n.a.

3.0710,

AN INTERNATIONAL EPIDEMIOLOGIC STUDY OF THE RELATIONSHIP BETWEEN TOBACCO USAGE AND LUNG CANCER

M. Kunze, Enviro Control Inc., *11300 Rockville Pike, 1 Central Plaza, Rockville, Maryland* 20852

OBJECTIVES: Since 1968, the Smoking and Health Program has sponsored a case-control study of the relationships between tobacco usage and cancer incidence in several U.S. cities. The purpose of the European studies is to increase and substantiate our understanding of these relationships, particularly with respect to cancer of the lung. The range of tobacco product used, the variations in incidence of lung cancer, the differences in smoking habits, and the diversity of socioeconomic, demographic and occupational characteristics of the European nations provide a promising epidemiologic setting for comparisons with the U.S. experience.

A retrospective case-control design is used, based on the U.S. protocol. Subjects are selected from several hospitals in each country. Cases are hospitalized patients with a histopathologically confirmed diagnosis of lung cancer. Two controls are matched to each case by sex, race, age and hospital status. A detailed questionnaire is administered by a highly trained interviewer, covering, among other topics, tobacco habits and socioeconomic, demographic, and occupational background. For these six studies combined, approximately 2,000 cases (with twice as many controls) are being interviewed annually.

A pilot study in Austria indicates that it is feasible to include pancreatic cancer patients as well as lung cancer patients as cases for these investigations.

MAJOR FINDINGS: Studies of this nature usually require several years of observation before meaningful results are possible; thus, no significant findings are available at this time. However, preliminary results indicate that the variations anticipated among respondents from the different countries are emerging. Statistical analyses and epidemiologic interpretations of the data will be performed as a sufficient number of responses become available.

SIGNIFICANCE TO BIOMEDICAL RESEARCH AND THE PROGRAM OF THE INSTITUTE: The results of this study will be compared to those obtained from other Smoking and Health Program case-control studies to clarify the role of smoking usage and other factors in the development of lung cancer. These studies address two Smoking and Health Program objectives: to identify individuals at high risk to tobacco-related disease, and provide information on smoking habits and patterns related to disease.

3.0711,

EPIDEMIOLOGIC INVESTIGATION OF THE RELATION BETWEEN BLADDER CANCER, SACCHARIN USAGE, AND SMOKING

S.D. Stellman, American Health Foundation Inc., *320 E. 43rd St., New York, New York* 10017

OBJECTIVES: The objective of this study is to determine reliability of responses regarding saccharin usage and other epidemiologic indices obtained from bladder cancer cases and matched controls interviewed in two hospital and city settings from 1974 to 1979.

Cases and controls interviewed since 1974 in connection with the Foundation's ongoing Epidemiologic Study of Smoking-Related Diseases comprise the sample for this study. Names, addresses, telephone numbers, and survival status were obtained from hospital records. Subjects not known to be deceased and for whom addresses were available were reached for their consent to participate in the study in the response mode of their preference, i.e., by telephone interview or self-administered questionnaire. Non-respondents to the initial letter of contact were followed up by correspondence and later by telephone. Data were subsequently collected from subjects in the mode of their stated choice. An abridged form of the original questionnaire was used which additionally included a measure of internal consistency of saccharin use. Data analysis consisted of (1) comparison of risk ratios of saccharin usage in relation to bladder cancer between the original data and data obtained from the re-interview, (2) determining reliability measures of the data on use of artificial sweeteners and other variables, (3) comparison of congruence between original and re-interview data obtained from two cities, and (4) comparison of response reliabilities using either the telephone interview or the self-administered questionnaire mode.

MAJOR FINDINGS: This is a short-term study for which only preliminary analyses have been performed thus far.

SIGNIFICANCE TO BIOMEDICAL RESEARCH AND THE PROGRAM OF THE INSTITUTE: This study is in accord with the stated objective of identifying individuals at high risk to tobacco-related diseases. It is designed primarily to address the issue of possible interactive effects between tobacco usage and consumption of artificial sweeteners.

PROPOSED COURSE: This effort expired on January 31, 1980.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. funds n.a.

3.0712,

DEVELOPMENT OF RADIOGRAPHIC TEACHING MATERIALS ON ASBESTOS FOR PHYSICIANS

J. Merchant, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, National Inst. for Occupational Safety & Health, *944 Chestnut Ridge Rd., Morgantown, West Virginia* 26505

OBJECTIVES: This interagency agreement supports the preparation of a teaching module with an emphasis on the roentgenographic manifestations of asbestos related disease. This agreement will be part of an ongoing contract between the American College of Radiology and the National Institute of Occupational Safety and Health which has produced teaching materials for the Coal Miners' Black Lung Program. This module on asbestos related lung disease will help achieve one of the primary goals of the Division of Cancer Control and Rehabilitation, National Cancer Institute; i.e., the assistance of health professionals in the application of new and available knowledge and technologies to improve the diagnosis and treatment of cancer.

ACCOMPLISHMENTS: The module, which is nearing completion, consists of a written text describing the clinical manifestations, epidemiology, pathology and roentgenology of asbestosis. Associated tables, photographs, slides and radiographs illustrate the text. Case descriptions accompany the radiographic reproductions and slides. Thirty full-size chest x-rays show asbestos related disease including lung cancer and mesothelioma. Instruction in the utilization and application of the International Labor Organization's classification system is also given. A sample classification is completed for each film in the set.

PLANS: The completed module will be distributed to medical school teaching centers for the instruction of residents and medical students. Home study sets will be loaned to physicians on request.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $608,667

3.0713,

HUMAN HEALTH CONSEQUENCES OF POLYBROMINATED BIPHENYLS (PBBS) CONTAMINATION OF FARMS IN MICHIGAN

C.W. Heath, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, *1600 Clifton Rd. N.E., Atlanta, Georgia* 30333

OBJECTIVE: As a consequence of the distribution of animal feeds contaminated with PBB, the inhabitants of at least 412 Michigan farms as well as a wide surrounding belt of consumers, were accidentally exposed to that potentially threatening compound. This activity defines and recruits large cohorts of individuals (of several degrees of exposure) and will engage in a long-term follow-up primarily with respect to the incidence of cancer.

MAJOR FINDINGS: The major effort to date has been the development of cohorts. Two blood samples have been taken from all PBB exposed individuals and analyzed for this compound as well as for polychlorinated biphenyls (PCBs); this is of equal interest scientifically and provides gratuitous information. Certain high risk groups (high blood level individuals engaged in the production of the PBB compound and children born during or after the incident) continue to be monitored closely. The initial scientific impression that there were little or no immediate or acute effects on the subject population appears to have been verified.

SIGNIFICANCE TO BIOMEDICAL RESEARCH AND PROGRAM OF THE INSTITUTE: This is a unique situation in which a large group of people had a known exposure to a potential carcinogen under sharply defined circumstances of geography and time. Unfortunate subsequent rises in cancer incidence, if they occur, can thus be charted in this prospective study and correlated with modes and amount of exposure. Major scientific observations on this particular compound and structurally allied compounds can be developed.

PROPOSED COURSE: Cohorts having been defined and recruited, the major effort for the foreseeable future is to maintain their integrity for the long-term determinations. Deaths, illness, pregnancies, etc., will be carefully monitored. It is anticipated that the scaling down of effort will continue to some degree because of the completion of major tasks.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $200,255

3.0714,

STUDY OF THE HUMAN HEALTH SIGNIFICANCE OF THE POTENTIALLY CARCINOGENIC ENERGY RELATED ORGANIC AND INORGANIC CONTAMINANTS IN WATER

J. Hushon, Mitre Corp., *P.O. Box 208, Bedford, Massachusetts* 01730

OBJECTIVES: To develop a state of the art report on bioassay, monitoring, identification, and classification of energy and environmental chemicals that are carcinogens and mutagens, and delineation of an evaluation of epidemiological studies that relate such aquatic contaminants to adverse effects in aquatic and mammalian species, including carcinogenic effects from such exposures to water contaminants.

MAJOR FINDINGS: This project which has been completed, has delineated all the bioassays used in various animal models, provided a description of all monitoring systems in all federal agencies, a description and cataloguing of over 2,300 chemicals in raw water and specific listing of carcinogens and mutagens in drinking water and an indepth evaluation of the dozen or more epidemiological studies on populations exposed to these contaminants.

SIGNIFICANCE TO BIOMEDICAL RESEARCH AND PROGRAM OF THE INSTITUTE: The preliminary reports made available through a briefing session in July 1979 indicates that this comprehensive survey will provide a very significant report (probably 3 volumes) which puts in perspective for the biomedical community and specifically government agencies, including DOE and NCI, a clear picture of the impact of these contaminants on environmental health including cancer.

PROPOSED COURSE: This project was extended beyond the original one-year plan to eighteen months. It has been completed and the reports are currently being printed.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $115,999

3.0715,

EPIDEMIOLOGY OF SMOKING-RELATED DISEASES

E.L. Wagner, American Health Foundation Inc., *320 E. 43rd St., New York, New York* 10017

OBJECTIVES: The objectives of this project are to evaluate the risk associated with various smoking habits, including the type of cigarettes smoked, to identify the kinds of cigarettes that may be less carcinogenic to various body organs, and to measure the association between the smoking of various tobacco products and the development of myocardial infarction. This retrospective case-control study uses two sets of controls: One consisting of hospitalized patients and the second consisting of non-institutionalized persons residing in the same neighborhoods as the index cases.

MAJOR FINDINGS: The study continues to demonstrate a dose-response relationship between cigarette smoking and development of cancer of the larynx, lung, oral cavity, esophagus and bladder for both sexes. After adjusting for duration of the smoking habit, inhalation, and butt length, relative risks of developing lung or larynx cancer were consistently lower among long-term smokers of filtered ciagarettes (low tar) than among non-filtered cigarette smokers. For ex-smokers, the risk decreased with increased years of cessation. Risk of mouth cancer for pipe and cigar smokers, who inhaled much less than cigarette smokers, increased with the quantity smoked. Risk of mouth, larynx and esophagus cancer among smokers increased with the quantity of alcohol consumed. More extensive smoking and lower cessation rates were noted among lower socioeconomic groups, suggesting that these groups will bear an ever increasing proportion of the burden of tobacco-related diseases.

In accord with the literature, smoking among women is becoming increasingly more prevalent and, contrary to previous reports, persons smoking filtered cigarettes do not appear to significantly increase their levels of consumption once they have changed from a non-filter to a filter cigarette. In addition, when comparing case cohorts, one finds a significant increase in cigarette consumption among young people. Younger cancer patients generally have smoked more cigarettes than older patients. This is consistent with the observation that industrywide cigarette tar yields have been gradually decreasing over the years, and larger quantities are required to obtain the same risk levels. (Text Abridged.)

3.0716,

CASE-CONTROL STUDY OF LUNG CANCER INCIDENCE IN CUBAN IMMIGRANTS TO THE U.S.

N.A. Dreyer, Equifax Inc., *100 Main St., Reading, Massachusetts* 01867

OBJECTIVES: A case-control investigation of lung cancer incidence in Havana, Cuba, has been sponsored by the SHP for almost three years. A companion study among Cuban immigrants now residing in the Miami/Dade County area of Florida was initiated to complement the information being obtained in Cuba. In particular, the new study is designed to investigate effects on lung cancer incidence associated with changes in the types of tobacco products used, in socioeconomic and demographic variables, in lifestyle factors and in related characteristics that occurred subsequent to immigration.

The protocol for the immigrant study is the same as that being used in Havana; cases and patients hospitalized with histopathologically verified lung cancer, and two controls are matched to each case by age, sex, race, and hospital accommodation. One control is a patient hospitalized for reasons other than a tobacco-related disease and the other control is a non-hospitalized subject residing in the same neighborhood as the case. The questionnaire in both studies is essentially the same. The main difference between the studies is that male and female respondents are recruited in the Havana study, while only male respondents are to be recruited in the Miami/Dade County study.

MAJOR FINDINGS: This study is still in the initial phases of training the interviewers and obtaining hospital cooperation. Data collection as such has not yet started.

SIGNIFICANCE TO BIOMEDICAL RESEARCH AND THE PROGRAM OF THE INSTITUTE: The results of this study will be compared to those obtained from other SHP case-control studies, particularly the Havana study, to clarify the role of smoking and other factors in development of lung cancer. This study directly addresses the two of the principal SHP objectives: To identify individuals at high risk to tobacco-related diseases and provide information for use in developing less hazardous cigarettes.

PROPOSED COURSE: It is planned that this effort will undergo peer review for determination of continued efforts.

INTERNATIONAL EPIDEMIOLOGY STUDY GLASGOW, SCOTLAND

C.R. Gills, Ruchill Hospital, *520 Bilsland Dr., Glasgow G20 9NB, Scotland, United Kingdom*

As part of the National Cancer Institute's Smoking and Health Program, the study is an extension of the tobacco and health survey being conducted in six major cities in the United States and the International Agency for Research on Cancer in Cuba, and the European environment. The program continuation is of significance because the range of smoking products in use by large and diverse human populations of Europe, and the range of incidence of lung cancer among these populations, permit strong comparisons with experience in the United States and Cuba. The project is urgently needed to provide a common (international) basis for measuring risk and clarifying the impact of alternative smoking products on differing human population segments. Data collection and analysis by strictly comparable methods ameliorate uncertainties attendant to past intranational studies and provide information of unique value in regard to smoking and health.

3.0731,
COUNTY POPULATION ESTIMATES BY AGE, RACE AND SEX FOR THE 1970'S
R. Engels, U.S. Dept. of Commerce, Social & Economics Statistics Admin., Bureau of the Census, *Washington, District of Columbia* 20233
OBJECTIVES: This agreement covers the experimetal development of estimating methodology and the preparation of estimates of the resident population for all United States counties by age, race and sex by calendar year from 1970 (July 1). These estimates are needed between the actual years in which the census is taken (1950, 1960, 1970, 1980, ect.)
METHODS: The county units provided will either be identical with the units used by the National Cancer Institute in its publication of 1950-69 mortality data, or subsets thereof. The estimates will be by age (5-year groups to 85 years and over), cross-classified by sex and race (two groups: White and Black and Other Races). The initial model design will produce estimates for the age groups 65-69, 70-74, and 75 and over, and if the data prove to be of acceptable quality, the age range will be extended accordingly.
MAJOR FINDINGS: The contractor has provided the NCI with preliminary estimates of population by age, race and sex for individual counties in the United States by calendar year from 1970 through 1977. These estimates are currently undergoing testing with regard to their compatibility with earlier population estimates which have been utilized by the NCI. It is currently projected that estimates for county populations for the calendar year 1978 will be available to the NCI by July, 1980.
SIGNIFICANCE TO BIOMEDICAL RESEARCH AND THE PROGRAM OF THE INSTITUTE: There is no readily available source of population estimates at the county level for the time period in question, 1970 to the present. These populations are vital to the continuance of investigations concerning the geographic distribution of malignancy in the United States which the Environmental Epidemiology Branch has developed over the past several years.
PROPOSED COURSE: This project represents the first step in a program designed to produce annual population estimates on a regular basis in the detail specified, so as to meet the needs of the National Cancer Institute. A continuing relationship with the National Cancer Institute in reviewing and improving the estimating methodology is foreseen, and the Bureau of the Census is engaged in a cooperative effort with State agencies to improve the methodology and strengthen the estimates.
SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $30,000

3.0732,
EPIDEMIOLOGIC STUDIES OF CANCER IN ALASKAN NATIVES
A.P. Lanier, U.S. Dept. of Health & Human Services, Public Health Service, Center for Disease Control, *Washington, District of Columbia* 20201
OBJECTIVES: To study the incidence of cancer in Alaskan natives from 1974 onward and the mortality from cancer in Alaskan natives from 1960 to the present; to investigate several striking familial aggregations of cancer in Alaskan natives, particularly nasopharyngeal cancer and hepatocellular carcinoma; and to search for environmental determinants of nasopharyngeal cancer, with particular emphasis on the presence of nitrosamines in Alaskan preserved fish.
METHODS EMPLOYED: Newly diagnosed cancers and cancer deaths among Alaskan natives will be ascertained through the facilities of the Public Health Service Hospitals in which virtually all Alaskan natives receive their health care. The data will be collected in a format compatible with the SEER Registries to permit comparison with other U.S. populations. Cancer-prone families will be studied in collaboration with professionals from the Family Studies Unit of NCI's Environmental Epidemiology Branch, utilizing clinical and laboratory protocols tailored to the malignancies to be evaluated. This will include hepatitis B and Epstein-Barr virus assays, immunologic and genetic tests, and other serologic markers aimed at uncovering mechanisms of disease susceptibility. A case-control study of nasopharyngeal cancer is planned, which will focus on dietary exposures of possible etiologic interest. Samples of suspect native food items will be assayed for the presence of nitrosamines.
MAJOR FINDINGS: Since the project has only been under way for four months, there are no preliminary findings to report. Necessary personnel have been hired, a SEER-compatible abstract form designed, population estimates for the period of study developed, and the case-control study interview instrument is in the design stages. An agreement has been reached with the Eppley Institute in Omaha to conduct the nitrosamine studies.
SIGNIFICANCE TO BIOMEDICAL RESEARCH AND THE PROGRAM OF THE INSTITUTE: The projects in this proposal are directed toward investigating the unusual patterns of cancer in the culturally and geographically unique population that Alaskan natives represent and identifying risk factors for these cancers.
PROPOSED COURSE: This study is intended to cover a two-year period. The collection of morbidity and mortaligy data will be initiated in the first year. (Text Abridged.)

CANCER IN ARSENIC-EXPOSED POPULATIONS

P.E. Enterline, University of Pittsburgh, Graduate School of Public Health, Dept. of Biostatistics, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260

The mortality experience of workers at a copper smelter in Tacoma, Washington, where nearly all the arsenic trioxide in the United States is produced, is being studied. Men employed a year or more between January 1, 1940, and December 31, 1964, have been followed for deaths through December 31, 1977. The cancer mortality experience of this cohort is being related to duration and intensity of arsenic exposure and latent period. Historic urinary arsenic measurements on workers are used to estimate exposures.

In addition, the mortality experience of persons living near the smelter is being studied to see if any effect of atmospheric contamination on cancer mortality can be detected. This includes: a) follow-up of children from an elementary school in the area using a cohort identified from school records between 1900 and 1919, and b) a study of mortality by census tract for Tacoma in which mortality in areas adjacent to the smelter will be compared to mortality in non-adjacent areas.

EFFECT OF ORAL CONTRACEPTIVES ON CARCINOGEN METABOLISM

R. Gingell, University of Nebraska, Lincoln Campus, Graduate School, *Lincoln, Nebraska* 68508

There has recently been much concern over the possible association of hormone imbalance with human cancer in various organs. Prominent among these are the proposed association between oral contraceptives and the occurrence of benign hepatomas, and the increased incidence of breast and endometrial cancer in post-menopausal women which is accentuated by estrogen therapy. Despite a reported association of oral contraceptives with breast cancer in women and dogs, a positive correlation remains uncertain, and most current epidemiological evidence would suggest a protective role, if any.

DIET AND CHOLESTEROL METABOLISM IN BREAST CANCER
A.E. Papatestas, City University of New York, Mount Sinai School of Medicine, School of Medicine, Dept. of Surgery, *1 Gustave L. Levy Pl., New York, New York* 10029
OBJECTIVES: To evaluate whether dietary and/or metabolic factors affect patterns of breast cancer development in general, and to identify which components of the diet are those which may affect breast cancer risk directly, or through metabolic changes. An attempt will be made to evaluate whether environmental dietary factors are more important than genetic metabolic factors in affecting cancer risk.

FOLLOW-UP FLUOROSCOPICALLY EXAMINED TUBERCULOSIS PATIENT

R.R. Monson, Harvard University, Cambridge Campus, School of Public Health, Dept. of Epidemiology, *Cambridge, Massachusetts* 02138

Recontact former Massachusetts tuberculosis sanatoriums and obtain necessary permission and clearances to conduct the study. Select the population to study: both women and men who were discharged alive and who received various treatments for pulmonary tuberculosis. Design forms to abstract medical information and location information from medical records. Abstract medical and location information on all subjected selected for study. Locate the population selected for study. Design a patient questionnaire to obtain information on current and past disease status, especiallycancer history. Mail the questionnaire to all patients located alive. Validate all reported cancer diagnosis. Computerize the medical record data, questionnaire response data, and death certificate data. Determine radiation organ doses as accurately as possible.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Cancer Inst. $327,535

EPIDEMIOLOGY OF BENIGN BREAST DISEASE

B. Modan, Chaim Sheba Medical Center, *Bitan 27, Tel Hashomer, Ramat Gan, Israel*

To try to determine the characteristics of patients with different types of non-invasive breast lesions, with particular reference to those factors reputed to be preferentially associated with breast cancer, and to compare the findings with our similarly conducted breast cancer study. The proposal consists of two phases: (a) case control interview study of 600 cases of non-invasive breast disease, in terms of such risk factors as age at first birth; menstrual history; menopausal status; parity; height and weight; familial breast cancer selected drug history; dietary intake and previous radiation exposure; (b) an incidence study of non-invasive breast lesions in a total community. In both phases, particular attention will be paid to the relative frequency of distinct histopathological forms in subpopulations at high and low risk sub-populations for breast cancer (i.e., Eurpoean vs. Asian and African born). The characterization of the breast lesions will take into account the histological pattern, degree of atypia and lymphoreticulo-endothelial response (LRE).

Identifying a high risk population for breast cancer is the utilization of the results.

TOXOCARA INFECTION AND OCULAR DISEASE

L.T. Glickman, University of Pennsylvania, School of Veterinary Medicine, Dept. of Clinical Studies, *39th & Pine, Philadelphia, Pennsylvania* 19104 (R01 EY 03762-01)

The principal objectives of this proposal are to measure the serologic prevalence of toxocara canis infection in persons in the United States, to determine the epidemiologic pattern of infection with respect to demographic and geographic factors, and to assess the possible association of infection with visual deficits and ocular disease. For this purpose, we will perform the enzyme-linked immunosorbent assay (ELISA) on 8594 sera which were collected during the National Health and Nutrition Examination Survey of 1971-1973. Detailed demographic, medical, and ophthalmologic information is available for each of the participants.

Another objective is to define the clinical, pathological, and immunological response of nonhuman primates with experimental ocular toxocariasis. Cynomolgus monkeys will be infected by either the gastrointestinal or intravitreal route to study the pathogenesis and pattern of larva-specific antibody production in the serum, aqueous and vitreous humor. This information will aid in the interpretation of serologic test results from children with suspected toxocaral visceral larva migrans or ocular toxocariasis.

NATURAL HISTORY OF ANGLE CLOSURE GLAUCOMA SUSPECTS

P.L. Kaufman, University of Wisconsin, Madison Campus, Medical School, Dept. of Ophthalmology, *450 N. Randall Ave., Madison, Wisconsin* 53706 (R01 EY 03503-01)

Primary angle closure glaucoma is a significant cause of visual loss and blindness. Appropriate therapy, however, when administered in time is highly effective in curing the disease and preventing loss of vision. It is also a disease that usually occurs acutely with little or no previous warning. Research to date has done little to provide indicators that might accurately identify eyes at risk so that appropriate treatment could be instituted prior to the onset of an acute (potentially blinding) attack. Recognizing these facts, the National Advisory Eye Council Vision Research Program Planning Committee indicated an urgent need for the study of early detection and treatment of angle closure glaucoma patients. The present project is designed as a two center coordinated study to determine the natural history of angle closure suspect patients. These patients will be subjected to an initial examination that will include a physiologic angle closure provocative test (the dark-room prone test), measurement of the anterior chamber depth by pachometry and determination of the axial length by the use of ultrasonic technique. The patients will then be followed expectantly for five years. It is expected that we will be able to more clearly determine the attach rate in this population and determine whether there are any correlations between the results of the provocative test or the biometric parameters and the subsequent incidence of acute attacks. This information could then provide the hard data that are needed to indicate whether specific Clinical trials or other studies are indicated or justified.

SUPPORTED BY U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Eye Inst. $18,403

EPIDEMIOLOGICAL STUDY OF DIABETIC RETINOPATHY

R. Klein, University of Wisconsin, Madison Campus, Medical School, Dept. of Ophthalmology, *450 N. Randall Ave., Madison, Wisconsin* 53706 (R01 EY 03083-02)

A population of over 10,000 diabetic patients receiving their primary care from over 450 collaborating physicians (representing over 98 percent of physicians in this category) in an eleven county area were identified. During the first year of the study, charts were reviewed and information such as age of onset and duration of diabetes, current age, medication status level of glucose control, and blood pressure status was recorded.

In the second and third years of the study all juvenile onset insulin dependent diabetic patients (Type I) and a sample of adult onset (Type II) diabetic patients will be examined. The examination will consist of a questionnaire, a complete eye examination with vision determined by ETDRS protocol, stereo fundus photographs, height, weight, and blood pressure determination using HDFP protocol, and urine analysis with C-peptide determination.

The prevalence and severity of diabetic retinopathy will then be determined and the association between the onset, progression and severity of retinopathy and diabetes type, duration, blood pressure level, smoking history and other factors will be determined.

BIOCHEMICAL & CYTOGENETIC MARKERS IN RETINOBLASTOMA

A.L. Murphree, Childrens Hospital of Los Angeles, *4650 Sunset Blvd., Los Angeles, California* 90054 (R01 EY 02715-02)

The linkage between esterase and the retinoblastoma gene on chromosome 13 is being investigated. Various human retinoblastomas from both sporadic and hereditary cases are being propagated intraocularly and subcutaneously in the nude mouse. Esterase D activity and the electrophoretic pattern is being investigated in the primary tumors and those grown in the nude mice. Similarly the chromosome pattern of each tumor is being evaluated using the trypsin-Giemsa banding technique. In addition, blood samples from patients with both hereditary and sporadic retinoblastoma are being evaluated for their esterase D activity. This is a large scale study involving patients throughout the country. Dr. Robert Sparkes at UCLA Medical School is collaborating on this project.

CASE CONTROL STUDY OF DIABETIC RETINOPATHY

L.I. Rand, Joslin Diabetes Foundation Inc., *170 Pilgrim Rd., Boston, Massachusetts* 02215 (R01 EY 02636-03)

We propose a study of age, sex and duration matched long-term diabetics (15 years or more), some of whom gave no evidence of diabetic retinopathy (controls), others with proliferative diabetic retinopathy (cases), in regard to the distribution of selected demographic systemic and ocular factors to determine if the distribution of any one particular, or

any several of these factors, when taken independently or together is sufficiently different between the two groups to be considered a risk factor(s) or a protective factor(s) in the development of diabetic retinopathy.

Patients will have an interview during which questions about medical and social factors possibly associated with the development of diabetic retinopathy will be asked. Patients will also have a standard eye examination, with stereo fundus photographs of seven standard fields taken to be used for classification of retinopathy. Those patients without visible retinopathy will have fluorescein angiography performed according to a standard protocol. Blood specimens will be drawn for analysis to evaluate systemic and metabolic factors that may play a role in the development of diabetic retinopathy.

After all patients have been examined, photographed, interviewed, and had their laboratory evaluation, the data will be analyzed and estimations of relative odds for each individual variable studied will be computed. In addition, it is planned to look at combinations of variables as risk factors and to develop a multivariate risk function analysis of selected variables. Patients free of retinopathy (controls), will be followed prospectively at yearly intervals to evaluate the predictive value of the risk factors identified.

HLA AND GENETIC STUDIES IN DIABETIC RETINOPATHY

R.C. Ramsay, University of Minnesota, Minneapolis Campus, School of Medicine, Dept. of Ophthalmology, *1305 Mayo, Minneapolis, Minnesota* 55455 (R01 EY 02455-03)

Diabetic retinopathy represents a major cause of blindness in the U.S. today. Presently, no method allows a prediction that advanced retinopathy will later develop in an individual with diabetes mellitus. There is evidence from twin and ethnic studies that genetic factors, in addition to metabolic factors, may affect the development of severe retinopathy. The proposed study will test the hypothesis that there are one or more 'microangiopathy genes' in linkage dysequilibrium with HLA genes which determine susceptibility to severe diabetic retinopathy.

Diabetic populations to be studied include groups of JIDD and AOD patients selected by the documented presence or absence of proliferatve retinopathy. The value of HLA antigen associations as predictors of visual outcome will be studied by an evaluation of the patients followed in the DRS and ETDRS at the University of Minnesota. In addition, diabetic multiplex families with a high prevalence of proliferative retinopathy will be studied for linkage analysis.

These students will permit an evaluation of the role of HLA-related genetic markers in the development of proliferative diabetic retinopathy.

INCLUSION CONJUNCTIVITIS OF THE NEWBORN

J. Schachter, University of California, San Francisco Campus, School of Medicine, Dept. of International Health, *551 Parnassus Ave., San Francisco, California* 94122 (R01 EY 02216-04)

The overall objectives of this project are to determine the prevalence of common bacterial pathogens in conjunctivitis of the newborn with a specific emphasis on the prevalence of inclusion conjunctivitis (IC). The risk of acquiring inclusion conjunctivitis will be determine by a prospective study based upon screening pregnant women for cervical chlamydial infection and following their infants. In addition to development of eye disease, an effort will be made to determine the incidence and prevalence of extra ocular chlamydial infections in the infants. The major emphasis will be placed on respiratory infection in exposed infants, whether or not they develop eye disease.

REEXAMINATION OF FRAMINGHAM HEART STUDY COHORT

T.R. Dawber, Boston University, School of Medicine, Dept. of Medicine, *80 E. Concord St., Boston, Massachusetts* 02215

Prepare and print examination forms, perform physical examinations including laboratory tests, assessment reviews, and take medical histories of all surviving members of the Framingham Cohort. For Cohort members who are unable to come to the examination center, arrange or perform a home physical examination. For Cohort members who no longer reside in the Framingham area, determine their health status by the use of mail questionnaires or telephone interviews.

SERIAL EXERCISE TESTING IN HIGH RISK MEN

N.L. Lasser, College of Medicine & Dentistry of New Jersey, New Jersey Medical School, School of Medicine, Dept. of Medicine, *100 Bergen St., Newark, New Jersey* 07103 (R01 HL 22848-02)

Although the submaximal graded exercise test (GXT) has become popular for the detection of preclinical ischemic heart disease, its predictive accuracy in asymptomatic subjects is low. The accuracy increases to 85% with serial testing, and the measurement of systolic time intervals (STI's) can greatly enhance predictive power. It is proposed to perform serial GXT's and pre- and post-exercise STI's at each annual examination of men participating in the Multiple Risk Factor Intervention Trial (MRFIT) in Newark. MRFIT, a multiple center collaborative Federally-sponsored clinical trial aimed at determining whether treatment of multiple risk factors (hypercholesterolemia, hypertension, smoking) reduces coronary mortality, is being carried out in 12,000 high risk men, age 35-57, in control and experimental groups, with a 6-year followup. A baseline submaximal GXT was performed but will be performed again as part of the national protocol. Continuation of GXT's at the Newark Center is an ancillary study requiring outside funding. Tests are being carried out annually in the 632 men attending the Newark Clinic utilizing a Marquette Series 3500 Exercise System recording on paper and magnetic tape and an Irex Continu Trace 101 recorder, with computer analysis of the tapes at the MRFIT ECG Center, Halifax, Nova Scotia. Data will be processed by the MRFIT Coordinating Center, where analyses will also be done. Analysis will be made of conversion rates of GXT's and changes in fitness levels. In addition to enhancing the power of the MRFIT these studies in this uniquely valuable population should demonstrate the ability to make the GXT a more accurate predictor of future coronary events and potential use of the test as an endpoint in clinical trials. These studies should indicate the utility of STI's as an adjunct to GXT and elucidate the effect of other lifestyle changes on exercise habits. Analysis of data from GXT's will examine correlations with other parameters. Data analyzed to date fail to reveal an association between GXT fitness measures and high density lipoprotein cholesterol levels.

POST-TRANSFUSION HEPATITIS IN NEWBORN CHILDREN

C.E. Stevens, New York Blood Center of Greater N.Y. Community Blood Coun., Laboratory of Epidemiology, *310 E. 67th St., New York, New York* 10021 (R01 HL 22838-03)

This project is designed to assess the incidence and etiology of post-transfusion hepatitis in newborn infants. Infants transfused during the newborn period and non-transfused control infants are followed for six months after entry into the study. Monthly blood specimens are tested for alanine aminotransferase level and appropriate sera are tested for serologic markers of hepatitis A, B, cytomegalovirus (CMV) and Epstein-Barr virus (EBV). Thus far eight of 160 transfused infants (5.0%) and none of 29 controls who have completed six months follow-up have developed hepatitis. All cases were asymptomatic and there was no serologic evidence of HAV, HBV, or CMV infection (EBV serology is not yet complete).

EARLY RISK PREDICTORS FOR CHRONIC PULMONARY DISEASE

I.B. Tager, Harvard University, Boston Campus, Peter Bent Brigham Hospital, *721 Huntington Ave., Boston, Massachusetts* 02115 (R01 HL 22528-04)

The present proposal is the continuation of the annual follow-up of a cohort of children age 5-9 years and their family members. The objective of the study is to identify factors for obstructive airways disease which operate early in life.

No strikingly new data have been generated since the previous summary. Efforts have been focused on solving methodologic problems encountered in the analysis of rates of change in pulmonary function in children during puberty. Once these problems have been solved, analysis will focus on the epidemiologic characteristics of children at various levels of growth of lung function. These analyses will be based upon years of observation of the cohort.

THE ETIOLOGY/PREVALENCE OF PERIPHERAL ARTERIAL DISEASE

M.H. Criqui, University of California, San Diego Campus, School of Medicine, Dept. of Community Medicine, *P.O. Box 109, La Jolla, California* 92093 (R01 HL 22255-02S2)

The objective of this study is to determine the prevalence of peripheral arterial disease (PAD) in a defined population by non-invasive techniques, to investigate the etiology of peripheral arterial disease by evaluating the association of certain cardiovascular disease risk factors with PAD, and to evaluate the degree of correlation between PAD and coronary heart disease (CHD) on a polulation basis in order to determine whether non-invasive tests of PAD can be used as a marker for CHD.

PAD is measured using four tests: (1) Flow velocity by Doppler ultrasound, (2) Segmental blood pressure, (3) Post-occlusive reactive hyperemia, and (4) Pulse reappearance time. Factors being investigated with regard to PAD include blood pressure, lipids, lipoproteins including the cholesterol/triglyceride ratio in VLDL, fasting plasma glucose, glycosylated hemoglobin, apoprotein E, a medical history, diet, medications, alcohol use, and cigarette smoking. Information on subsequent cause-specific mortality in this population will be obtained.

HEMODYNAMIC EFFECTS OF DIETARY SODIUM IN MAN

J.M. Sullivan, University of Tennessee, Center for the Health Sciences, School of Medicine, Dept. of Medicine, *62 S. Dunlap St., Memphis, Tennessee* 38103 (R01 HL 21523-03)

Compelling evidence links dietary sodium intake with the prevalence of hypertension in several human population groups around the world. Epidemiologic studies of man and selective inbreeding studies in rats suggest that most population groups contain individuals who are either salt-sensitive, salt-resistant, or who lie somewhere in between. Limited, short-term human studies suggest that the hemodynamic basis of these differences lies in sodium's property of decreasing vascular resistance in normal subjects while increasing resistance in hypertensive subjects. Additional studies are needed to verify this important point and to determine its long-term significance. Non-invasive methods of estimating changes in total peripheral vascular resistance in response to dietary sodium manipulation using echocardiography and venous occlusion plethysmography will be tested as a means of identifying salt-sensitive individuals in the population who might benefit from preventive dietary measures. These methods have the advantage of avoiding the anxiety-provoked sympathetic nervous system stimulation associated with the placement of right heart catheter or intra-aeterial cannulae. The relative effect of dietary potassium on peripheral vascular resistance will also be studied. The groups to be studied will include normal subjects, normotensive subjects with a family history of hypertension, subjects with labile essential hypertension and subjects with mild, fixed essential hypertension. The relationships of dietary sodium and potassium with urinary prostaglandin excretion in the various groups of patients will also be explored.

NATURAL HISTORY OF ASTHMA-METHACHOLINE TOLERANCE TEST

R.G. Townley, Creighton University, School of Medicine, Dept. of Medicine, *629 N. 27th St., Omaha, Nebraska* 68131 (R01 HL 21494-02)

We are interested in the factors responsible for the exquisite bronchial sensitivity of patients with bronchial asthma to certain mediators. This is a continuation of a population, genetic family study of certain host factors in bronchial asthma. This study deals with factors that are involved in determining the natural history of bronchial asthma in the general population. One of the major questions in this study is whether the bronchial sensitivity of asthmatic individuals to methacholine occurs at an early age even before clinical manifestation of the disease occurs. We intend to use the methacholine inhalation challenge test as a means of defining asthma and possibly using this as a marker for elucidation of its genetic characteristics. Another major part of this study is to determine whether asthma is acquired, genetically transmitted, and/or the result of interaction of environmental and host factors.

We intend to study the natural history of asthma and methacholine sensitivity in patients who currently have asthma, former asthmatics, their atopic and non-atopic siblings, concordant and discordant twin pairs and in persons in asthmatic families with alpha-1-antitrypsin phenotypes MS, MZ and MM. We will study the genetic characteristics of predisposition to asthma, in the above high risk groups as well as low risk groups such as non-atopic families. Parameters to be assessed include methacholine tolerance, allergy history and skin tests, serum IgE, protease inhibitor (Pi) types, and Histocompatability antigens.

CHARACTERIZATION OF PEDIGREES PRONE AND RESISTANT TO CHD

R.R. Williams, Utah Higher Education System, University of Utah, School of Medicine, Dept. of Internal Medicine, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (R01 HL 21088-04)

Genetic predisposition and resistance to early coronary heart disease (CHD) will be studied in a large sample of population-based pedigrees in Utah (100 with premature CHD, 40 with longevity, and 40 control pedigrees). CHD incidence and risk factor data will be sought for living members of 180 descending pedigrees, estimated to contain approximately 9000 persons. An estimated 2800 hospital charts will also be abstracted for deaths and persons with nonfatal CHD. Five thousand persons including children in 100 of these pedigrees will be screened twice in five years. Data collection will include blood cholesterol, triglycerides, HDL, and glucose, height, weight, skinfolds, and blood pressure; socioeconomic status, smoking, illnesses, medications, and hospitalizations; physician's history and physical exam, detailed family history and dietary evaluation. For adults age 18 plus, leisure and occupational activity questionnaires, ECGs, bench test estimates of functional aerobic capacity, and psychological tests (including Type A-B personality) will be collected.

Analyses will (1) determine the proportion of all premature coronary disease in a general population found in high risk pedigrees (and longevity in low risk pedigrees); (2) classify prone and resistant pedigrees by syndromes involving CHD risk factors, and determine the frequency of pedigrees by types; (3) assess gene-environment interaction, and (4) identify genetic mechanisms using pedigree diagramming, descriptive genetic indices, and maximum likelihood model testing. Results will elucidate underlying mechanisms of disease causation and provide important information for use in programs of CHD detection treatment and prevention.

GLYCEMIA, OTHER TRAITS AND CV DEATH IN 40,000 PERSONS

J. Stamler, Northwestern University, Chicago Campus, School of Medicine, Dept. of Community Health & Preventive Medicine, *303 E. Chicago Ave., Chicago, Illinois* 60611 (R01 HL 21010-04)

A second generation prospective epidemiologic study on atherosclerotic cardiovascular disease, particularly coronary heart disease, aims particularly to elucidate the role of glucose intolerance as an independent risk factor for macrovascular disease. It also has the goal of clarifying the role of other traits (e.g., hyperuricemia, obesity, rapid resting heart rate, pure systolic hypertension, ECG abnormalities) as risk factors, independent of the major risk factors (hypercholesterolemia, hypertension, cigarette smoking) demonstrated by the 'first generation' U.S. longitudinal epidemiologic studies. Almost 40,000 white and black men and women, chiefly 25-64 and identified in the Chicago Heart Association Project in Industry from 1967 to 1973 are to be followed for 10 years to determine the relationship of glucose tolerance (as well as clinically diagnosed diabetes, untreated and treated) and each of the other traits--with multiple other factors controlled--to rates of mortality from All Causes, Cardiovascular Diseases, Coronary Heart Disease, Sudden Coronary Death, Cerebrovascular Disease, and Cancers. For example, the contribution of glucose intolerace and clinical diabetes to risk of death, both cause-specific and all causes, is to be assessed with the following other baseline factors controlled in bivariate and multivariate analyses; age, serum cholesterol, blood pressure, cigarette smoking, relative weight, serum uric acid, heart rate ECG abnormalities, and such demographic variables as education and marital status for about 4,500 persons screened twice, the significance of two values and of changes in these variables for predicting risk is to be assessed. For 4,108 persons, the interplay between glucose tolerance and scores from the Jenkins Activity Survey (as well as other cited factors) in influencing risk of macrovascular disease death is to be evaluated. Analyses of the findings for this CHA cohort of 40,000 and its age-sex-race strata are proceeding in concert with corresponding analyses for the Chicago Peoples Gas Co. and Western Electric Co. studies. This endeavor is also part of an International Collaborative Group involving 15 prospective epidemiologic studies in Australia, Europe, Japan, and the U.S.A.

BLOOD GLUCOSE HGB A1C, AND DIABETIC VASCULAR DISEASE

K.H. Gabbay, Childrens Hospital Medical Center, Cell Biology Laboratory, *300 Longwood Ave., Boston, Massachusetts* 02115 (R01 HL 20539-04)

The association of diabetes mellitus with microvascular disease and accelerated macrovascular disease is a serious problem for the juvenile-onset diabetic patient. The contribution of poor diabetic control to microvascular and microvascular disease is not clear at the present time. A prospective evaluation of the role of diabetic blood glucose control in the development of these complications requires adequate and precise assessment of blood glucose levels over an extended time period. It is proposed that serial measurements of glycosylated hemoglobins will provide an accurate integrated index of blood glucose levels in the diabetic patient over an extended period of time. This hypothesis will be tested with a follow-up of 100 juvenile diabetic patients over a five year period. The association of such indices of blood glucose control will be correlated with the development and progression of microvascular disease. Quadriceps capillary basement membrane thickness obtained on muscle biopsies at the beginning of the study, and two and four years later, will be used to assess the progression of microvascular disease during the study period. Both indices of diabetic blood glucose control, and the progression of capillary basement membrane thickness will be correlated with the traditional risk factors for the development of macrovascular disease in this population. In addition, the profiles of risk factors for macrovascular disease in the diabetic patients will be compared to similar profiles in a non-diabetic sibling population to determine whether the usual risk factors are mediators of the accelerated atherogenesis seen in diabetes.

PROSPECTIVE BUNDLE BRANCH BLOCK STUDY

M.M. Scheinman, University of California, San Francisco Campus, School of Medicine, Dept. of Medicine, *551 Parnassus Ave., San Francisco, California* 94122 (R01 HL 20238-05)

The objective of the proposed research is to correlate measurements of atrioventricular node (A-H) and infranodal (H-Q) conduction times and refractory periods with total mortality, incidence of sudden death

and progression to higher grades of AV block in patients with bundle branch block (BBB). His bundle recordings will be obtained in patients with bundle branch agreeing to enter this study in order to estimate AV nodal and infranodal conduction time. These patients will be followed either in the cardiac clinic at San Francisco General Hospital, University of California, San Francisco or by private referring physicians. Either the patient or referring physician is contacted at 3 month intervals and pertinent physical findings, symptoms and a 12-lead ECG are recorded. 24- hour continuous ECG monitor is obtained at least 3 times per year and more often when clinically indicated. In the event of death, a Public Health Nurse interviews the patient's family or friends, reviews the death certificate or results of the postmortem examination (where available) in order to determine the cause and suddenness of the demise. Documented episodes of 2 degrees and 3 degrees AV block will be compiled. Analyses of the data will hopefully allow us to define a subset of patients with BBB who are at increase risk for development of either sudden death/or high grade AV block and may have important implications with regard to prophylactic cardiac pacemaker implantation in patients with BBB.

CORONARY RISK FACTORS IN CHILDREN

R.M. Lauer, University of Iowa, School of Medicine, Dept. of Pediatrics, *Jessup Hall, Iowa City, Iowa* 52240 (R01 HL 20124-04)

This study is concerned with coronary risk factors in school age children in Muscatine, Iowa. Measurements of heights, weights, triceps skin fold thickness, cholesterol and triglyceride levels, and blood pressure have been made on alternate years in an entire school district on alternate year since 1970. From these measurements studies of tracking (peer rank order consistency) of anthropometric measures, lipids and blood pressure have been described. Children whose blood pressure remain persistently in the upper quintile, mid quintile and lowest quintile of the distribution have been studied. These have been studied by echocardiography, and venous occlusive plethysmography. Children in the upper part of the distribution of blood pressure have higher cardiac outputs, and equal vascular resistance to those in the lower part of the distribution of blood pressure.

Those in the upper part of the distribution have significantly thicker interventricular septa and left ventricular posterior walls than those with lower pressures. Those with higher pressures also show an inability to maximally vasodilate their forearm vascular beds to the same degree as those with lower pressures. These observations indicated that children with higher blood pressures have thicker hearts and structurally different systemic vascular resistence beds.

FACTORS IN BLOOD PRESSURE LEVELS OF CHILDREN

G.E. Fraser, Loma Linda University, School of Health, Dept. of Biostatistics & Epidemiology, *Loma Linda, California* 92354 (R01 HL 20005-05)

The proposed work for year 05 of the study will largely involve analysis and reporting of results. In addition, there will be some effort put towards completing the final 5% of the data collection.

Reports will include the relationship of blood pressure to psychosocial factors and physical fitness, and to nutritional factors and demographic factors. This information will be assessed for both the children who are the primary participants in this study, and also their parents.

The relationship between the blood pressures of the children and their parents will be explored. The psychosocial factors investigated include Type A/B, psychosocial family support factors, and psychological distress measures.

Finally the percentage of variance explained by all of these factors will be assessed.

HIGH BLOOD PRESSURE IN THE YOUNG

J.M. Kotchen, University of Kentucky, School of Medicine, Dept. of Community Medicine, *Limestone & Euclid, Lexington, Kentucky* 40506 (R01 HL 19956-05)

This research involves a 7-10 year follow-up of identified populations of young adults to determine factors in adolescence associated with subsequent hypertension. We are following young mothers who, as adolescents, experienced hypertension during their first pregnancy and similar young mothers, normotensive during pregnancy. Recent follow-up studies at 3-6 years post partum indicate that women hypertensive during pregnancy and their children have higher blood pressure than controls; 14% of women hypertensive during pregnancy, but not control women, were found to have blood pressure greater than 140/90 on repeated measurements, and EKG studies showed evidence of increased left ventricular wall thickness. Group differences in renin-aldosterone responses to exercise were also found. We are following these women and their children to determine whether hypertension of pregnancy is associated with subsequent hypertension and the emergence of hypertensive cardiovascular disease in young mothers, and higher blood pressures in their children compared to controls.

We are also conducting a follow-up of young adults who participated in a blood pressure screening project during high school in 1973. A five year follow-up indicated that individuals in this population maintain their relative rank-order for blood pressure over time, and blood pressure measurements during adolescence are predictive of subsequent blood pressure. Relatively high blood pressures are associated with an increased prevalence of abnormal echocardiograms and exercise EKG studies. We are re-evaluating these individuals after 7-10 years to determine if relative blood pressure rank is maintained; to determine whether relatively high blood pressure in adolescence predisposes to hypertension and hypertension of pregnancy; to study aggregation of cardiovascular disease risk factors in young adults; to identify early evidence of cardiovascular disease. Sympathetic nervous system activity, the renin-aldosterone axis, and steroid responses to grades ACTH infusions are being studied in 'pre-hypertensive' young adults to identify mechanisms that may be involved in the pathogenesis of hypertension.

A PROSPECTIVE STUDY - BLOOD PRESSURE IN NEWBORN TWINS

H. Gelband, University of Miami, School of Medicine, Dept. of Pediatrics, *1400 N.W. 10th Ave., Box 520875, Coral Gables, Florida* 33152 (R01 HL 19930-05)

The primary research objective is to determine the relative contributions of genetics and environment to blood pressure levels among a group of newborn twins. Blood pressure is measured on days 0, 1, 2, 3, 14 and 1, 3, 6, 9, and 12 months. Zygosity is determined through blood group analysis, placental assessment of chorionicity, and clinical assessment of the infants' physical appearance. Placentation is also analyzed for each twin pair with respect to intravascular communications. Additionally, parents and siblings of the twins are evaluated as to blood pressure, height and weight. The ultimate purpose of this research is to shed light on the determinants of blood pressure levels during infancy.

HIGH BLOOD PRESSURE IN THE YOUNG, PREVALENCE & PRECURSOR

P.E. Baer, Baylor College of Medicine, School of Medicine, Dept. of Psychiatry, *1200 Moursund Ave., Houston, Texas* 77025 (R01 HL 19929-05)

The overall goal for the entire project is to determine whether there are psychological mediating factors that contribute to the aggregation of high blood pressure within families. This goal involved the study of hypertensive and normotensive parents, and their children. It will be determined whether parent-child interactions and family behaviors of hypertensive parents are related to personality characteristics which are correlated with high blood pressure. Blood pressure level and reactivity will be studied in hypertensive and normotensive parents and their children.

BLOOD PRESSURE OF CHILDREN AND YOUNG ADULTS

L.H. Kuller, University of Pittsburgh, Graduate School of Public Health, Dept. of Epidemiology, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (R01 HL 19864-03S1)

The project consists of two studies. The first study is a prospective investigation of blood pressure and heart rate in newborn infants with follow-up determinations conducted at 6, 15, and 24 months of age. The primary aims of the study are to establish the normal values of these variables in infancy, and to identify any possible racial difference in blood pressure and heart rate at this early age. The second portion of the project is an ongoing historical prospective study of the relationship between obesity, body type, social characteristics and casual blood pressure during adolescence and subsequent blood pressure levels in a predominantly white, middle-class population originally studied from 1957-1963.

BLOOD PRESSURE--PRECURSORS AND CONSEQUENCES

R.L. Watson, University of Mississippi, Medical Center, School of Medicine, Dept. of Preventive Medicine, *2500 N. State St., Jackson, Mississippi* 39216 (R01 HL 19858-05)

In this study we will reexamine selected samples of a cohort of women formed during 1965-1967, as well as children born to this cohort.

A portion of these women who had blood pressure measured during a school survey at the ages of 14 to 20 subsequently pregnant, and some developed preeclampsia. They delivered children now 6-11 years of age. Reexamination of the mothers and examination of the children is planned to determine if blood pressure of children of mothers in whom preeclampsia was diagnosed differs from those of mothers in whom no such diagnosis was made.

Urinary electrolytes, dietary histories, socioeconomic levels and other information, as well as repeat blood pressure determinations, were obtained in other subsamples of the school cohort. Reexamination is planned to determine the correlation of the previously obtained variables with present blood pressure status. In addition, siblings previously characterized will be reexamined to allow analysis of blood pressure aggregation in the face of the establishment of separate households and differing environmental patterns with time.

PREVENTION OF PROSTHETIC VALVE ENDOCARDITIS

G.L. Archer, Virginia Commonwealth University, Medical College of Virginia, Dept. of Medicine, *1200 E. Broad St., Richmond, Virginia* 23298 (R01 HL 19818-05)

The proposed research will investigate methods for prevention of prosthetic valve endocarditis (PVE) caused by the bacterium, Staphylococcus epidermidis, the most common organism causing these infections. The study will involve three phases. In the first phase, the antibiotic susceptibility of isolates from patients with PVE will be determined, mechanisms of

antibiotic resistance investigated, and the antibiotic susceptibility characteristics of the organisms related to time of onset of infections following surgery and the antibiotic prophylaxis used in each patient during surgery. In the second phase, antibiotic prophylaxis will be studied using a rabbit model of endocarditis. The value of prophylaxis in preventing infections due to antibiotic-resistant S. epidermidis and in selecting out these resistant isolates will be evaluated. The final phase of the study will be to define the hospital epidemiology of S. epidermidis and the methods of transmission of this organism to patients. Specific markers for hospital-acquired S. epidermidis will be sought using new epidemiologic tools, particularly those which characterize patterns of extrachromosomal DNA.

RESPONSE OF THE LUNG TO INJURY

C. Franzblau, Boston University, School of Medicine, Dept. of Biochemistry, *80 E. Concord St., Boston, Massachusetts* 02215 (P01 HL 19717-04)

Pulmonary emphysema and interstitial pneumonia are two diffuse lung diseases which may be viewed as responses of the lung to injury. One of the identifying features of emphysema is the specific alteration of the elastic tissue network, whereas in interstitial pneumonia, widespread involvement of many of the elements of the pulmonary parenchyma occurs. Understanding the nature of these processes has been limited in early stages of disease. We propose to study animal models of emphysema and diffuse interstitial pneumonia in a concerted attempt to gain insights into the pathophysiological and patho-biochemical changes which takes place in these progressing lesions. Lung mechanics and gas exchange will be examined. Connective tissue biochemistry, prostaglandins, catecholamines and cyclic nucleotides will be evaluated, and the full range of ultrastructural techniques will be applied to the various lesions. Modified elastases will be synthesized to study in these animal models. Studies on pure cell systems from lung will provide additional insights. In parallel studies, an assessment of lung growth and development in normal and pneumonectomized animals will be carried out employing many of the same physiologic, biochemical and ultrastructural techniques. Radioautography at the light and electron microscopic level are an integral part of all animal studies. The possible role of cell mediated immunity in the pathogenesis of these diseases will be investigated. A laboratory devoted to clinical epidemiological studies will interrelate with several of the medical science disciplines represented in the program. It is anticipated that the results of all these studies will give rise to greater understanding of processes of normal lung growth and the nature of the injuries and their repair which results in the development of pulmonary emphysema and chronic interstitial pneumonia. New diagnostic and therapeutic techniques may well derive from these studies.

PULMONARY SCOR - LUNG INJURY BY CHILDHOOD INFECTIONS

W.A. Clyde, University of North Carolina, Chapel Hill Campus, School of Medicine, Dept. of Pediatrics & Bacteriology, *Manning Dr., Chapel Hill, North Carolina* 27514 (P50 HL 19171-04)

An integrated, multidisciplinary research program is in progress which has as a general goal the identification and control of acute, intercurrent processes which may influence growth and development of the respiratory system with resultant long-term sequelae. Longitudinal studies of infants and children are establishing normal patterns of growth of lung function and the impact on this of acute respiratory infections with emphasis on the syndrome of bronchiolitis. This prospective clinical study is complemented by retrospective approaches of three types: 1) comprehensive evaluations of patients referred for recurrent or chronic progressive pulmonary diseases (including those with cystic fibrosis, sarcoidosis and anti-protease or immune deficiencies) to identify responsible defects in pulmonary defense mechanisms; 2) follow-up studies of children in the community documented to have had infections during the past decade with agents such as respiratory syncytial virus; and 3) assessment of the burden of pulmonary disability among North Carolina Children by development, testing and validation of pediatric questionnaires to facilitate case finding and early diagnosis. Relevant basic laboratory studies are being performed using experimental models of respiratory diseases (animals and cultures of specialized pulmonary cells infected with representative agents) to define the mechanisms of injury, repair and protection. This combination of clinical and basic research should lead to improve means of diagnosis, therapy and prevention of respiratory diseases and their complications or sequelae.

PULMONARY SCOR--CHRONIC DISEASES OF THE AIRWAYS

J.D. Brain, Harvard University, Boston Campus, School of Public Health, Dept. of Physiology, *55 Shattuck St., Boston, Massachusetts* 02115 (P50 HL 19170-04)

The goals of this proposed SCOR program are: 1) to generate new knowledge relating to the physiology, pathology, pharmacology, and epidemiolmgy chronic diseases of airways; and 2) to apply this knowledge of to the study of new modalities of therapy and prevention. We seek the effective integration of laboratory and clinical research and its focus on airways disease. Project 1 examines one important reservoir from which clinically significant disease arises, and seeks to explore the progression and reversibility of airways disease. Projects 3, 4, and 5 grapple with major issues of etiology: genetic, physiologic, pharmacologic, and environmental interactions which may provide and accelerate the pathophysiological changes leading to debilitating airways disease. Project 6 examines one of the consequences of airways dysfunction which leads to disability and respiratory failure. With Project 7 we begin to consider interventions; other aspects of disability and approaches to therapy are explored in Projects 8 and 9. The core units (Projects 10 and 11) provide essential services for the described research. We believe these projects represent a significant interdisciplinary attack directed toward chronic diseases of airways.

SUDDEN DEATH IN YOUNG ATHLETES

B.J. Maron, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Heart Lung & Blood Inst., Clinical Physiology Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 HL 01765-02 CB)

Sudden death occurring in competitive athletes is usually due to structural congenital cardiovascular disease. The most common cause of such deaths in this series was hypertrophic cardiomyopathy. While the suspicion of cardiovascular disease is often raised during life in such athletes, the coreect diagnosis is not often made clinically.

TWENTY-FOUR-HOUR BLOOD PRESSURE IN ADOLESCENTS

C. Ferencz, University of Maryland, Baltimore Professional Schools, School of Medicine, Dept. of Social & Preventive Medicine, *655 W. Baltimore St., Baltimore, Maryland* 21201 (R01 HL 25876-01A1)

The purpose of this research is to characterize in adolescents blood pressure variations which might be indicative of future hypertension, utilizing a non-invasive portable method of blood pressure determination in ambulatory, free-living adolescents representative of the State of Maryland population and dichotomized by a documented family history of hypertension. The findings of these two groups will also be compared to those of adolescents with primary and secondary hypertension.

This study will determine within-the-day fluctuations of blood pressure in adolescent members (12-18 years of age) of households chosen in a previous project as a probability sample of the Maryland population. The characteristics of the 24-hour blood pressure curves will be analyzed as the dependent variables in this descriptive epidemiologic study which will include variables of family data on hypertension, health and social status, and anthropometric, health, and life-style characteristics of the adolescents.

Comparison will be made of the findings in respondents free of a family history of hypertension and those with a family history of hypertension. A group of adolescents with primary and secondary hypertension, ascertained through medical sources, will be similarly studied. The results of this study will provide a sound epidemiologic basis for future in-depth exploration of alterations of blood pressure characteristics which may be indicative of future hypertension.

3.0836,

DEATHS TO 1980 AMONG FINNS WITH 1956 LIPOPROTEIN DATA

A. Keys, University of Minnesota, Minneapolis Campus, School of Public Health, Lab of Physiological Hygiene, *1325 Mayo Memorial, Minneapolis, Minnesota* 55455 (R01 HL 25823-01)

In 1956 the responsible investigator, with M.J. Karvonen, conducted medical surveys in Finland which included measurement of cholesterol in the alpha and beta lipoproteins separated by paper electrophoresis. Sampling in east and west Finland provided data on 869 clinically healthy men then aged 20 to 60. Some findings were published in the Lancet July 26, 1958.

Finland has a very high mortality from coronary heart disease which we verified in the Seven Countries Study (started in 1959 in Finland). It is estimated that by 1980 about 380 of our men of 1956 will be dead, 140 from coronary heart disease. It is proposed to ascertain the deaths and their causes, using the excellent Finnish death, citizenship, and National Pension System records. Staff members of the Finnish Heart Association will cooperate.

Analysis of relationships of the 23-year mortality with 1956 characteristics should illuminate the significance of the known risk factors and the theory that high density lipoproteins protect against coronary heart disease. Alpha and high density lipoproteins are essentially identical.

ASTHMA EPIDEMICS AND ENVIRONMENT - WHEN, WHERE AND WHY

I.F. Goldstein, Columbia University, School of Public Health, Dept. of Epidemiology, *600 W. 168th St., New York, New York* 10032 (R01 HL 25793-02)

The objective of this study of epidemic asthma is to develop models enabling the predictions in time and space of asthma epidemics by first: finding reliable and objective procedures for identifying such epidemics, second: to examine and interpret long-term trends in asthma, and third: to identify environmental factors including pollutants both man-made and biological and meteorological parameters associated with the epidemics.

The procedure will use data from municipal hospital emergency rooms in New Orleans and New York City, meteorological and demographic data, and such information as is available on industrial pollutants or natural allergens as seems relevant. Appropriate statistical techniques for time series analysis and cluster analysis have already been developed by the group, and additional techniques will be developed as needed.

ANTECEDENTS OF THE TYPE A BEHAVIOR PATTERN

K.A. Matthews, University of Pittsburgh, School of Medicine, Dept. of Psychiatry, *3550 Terrace St., Pittsburgh, Pennsylvania* 15261 (R01 HL 25767-02)

The present work constitutes a beginning step in identifying the psychobiological origins of the Type A behavior pattern, an established risk factor for coronary heart disease. Overt behavioral manifestations of Type A are extremes of competitive achievement-striving, a sense of time urgency and impatience, and an aggressive hostility. Individuals thought to exhibit those behaviors are called Type As, whereas those who do not are called Type Bs. Based on evidence from longitudinal studies of personality development, it was decided that childhood and adolescence are likely to be the periods when the overt characteristics of Type A emerge and stabilize. In order to study the origins of Type in the developing individual, a way of measuring Type A behaviors was needed. A set of rating scales, called the MYTH, was designed to identify children who are rated by their classroom teachers as exhibiting competitive achievement-striving, impatience, and aggression-hostility. The MYTH is reliable across time and can predict children's impatience and aggression. The current research was designed to complete the basic psychometric studies on the MYTH. Studies are being conducted to: (a) obtain an estimate of the MYTH's reliability; (b) examine the MYTH's validity as a measure of children's achievement-striving; and (c) investigate the hemodynamic responses during a challenging task of fifth grade children who score high and low on the MYTH. The last investigation was included because Type A adults as young as 18 years old show elevations in systolic blood pressure while performing a challenging task and thus, the present study can test for Type A adult-child similarities in hemodynamic responses.

ENVIRONMENTAL RISK FACTORS IN CONGENITAL HEART DISEASE

C. Ferencz, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (R01 HL 25629-01A1)

The objective of this epidemiologic study is to identify new risk factors for cardiac abnormalities which may result from interactions of multiple teratogenic agents or enhancements of fetal damage by non-teratogenic substances.

Index cases will be 750 infants with severe congenital heart disease identified over a 3-year period through the Regional Pediatric Cardiology Services in Baltimore and Washington. Control infants will be chosen at random from the births occurring in area hospitals served by the Cardiology Centers. Information will be obtained by home interviews. A precoded questionnaire administered to the mother will record details of pre and post-conception exposures to drugs, smoking, alcohol and caffeine. Home environmental exposures caused by heating and cooking fuels, and maintenance activities (paints, insecticides) and crafts and hobbies (solvents, laquer) will be noted. Occupational histories of mother and father will be examined by industry, type of job, and potential teratogen.

Analyses by multiple logistic regression will seek to elucidate additive and interactive effects of the various exposures, after adjustment for confounding variables. Because the multifactorial origin of congenital malformations is widely accepted, a summation or enhancement of environmental insults in the pathogenesis of congenital heart disease is a reasonable possibility, worthy of investigation.

COMMUNITY CONTROL OF HYPERTENSION IN MISSISSIPPI

D.A. Frate, Central Mississippi Inc., *Box 749, Winona, Mississippi* 38967 (R01 HL 25623-01)

This project centers on demonstrating the health and cost effectiveness of a hypertension control and education effort designed from a community-based perspective in a rural area in central Mississippi. The program involves: 1) the use of a local community organization as the grantee and focus of activities - Central Mississippi, Incorporated, 2) the involvement of local medical providers - Sidney A. Johnson, M.D., 3) the on-site scientific management of the Principal Investigator - Dennis A. Frate, Ph.D., 4) the use of local residents as the managers and educators, 5) the development of intervention strategies based on the social fabric of this area -extended family health counselors, 6) the use of computer based resources for training and education, 7) and the coordination of a scientific consortium skilled in health program design, clinical management, program evaluation and epidemiology.

This program will center on not merely the detection of hypertensives but on the management and education and the subsequent reduction in risk factors. A wide range of evaluation efforts are planned on the

closely randomized population and intervention groups to measure the overall health and cost effectiveness of this program. In addition to the control efforts, a carefully designed epidemiological investigation will be conducted into the genetic-environmental relationships in hypertension.

PSYCHOSOCIAL FACTORS AND COURSE AFTER HEART ATTACKS

W.A. Greene, University of Rochester, School of Medicine & Dentistry, Dept. of Medicine/Psychiatry, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (R01 HL 25266-01A1)

The primary goal of this proposal is to test specific hypotheses that a number of prospectively obtained psychosocial variables, personal losses or disappointments, unpleasant affects and social resources predict later complications of coronary heart disease. In addition tests will be made of hypotheses pertaining to other possible course predictors, demographic and behavioral.

The population includes 978 patients entering the CCU over four years, 1973-1976, with myocardial infarction (75%) and coronary insufficiency (25%). Eighty percent are males and twenty percent are females. After initial data collection just prior to hospital discharge, patients are seen every 4 months for seven contacts and then every 8 months for four contacts, a total of 11 follow-ups during five years.

Initial hospital predischarge data include the following independent variables: 1) antecedent demographic, comorbidity, family health, and prodromal clinical symptoms, social change and home dissatisfactions, 2) diagnosis and severity of the index coronary event, 3) post-event affects dimensions and a 6-hour Holter ECG recording for arrhythmias. At each subsequent follow-up the same interval clinical status, social circumstances, concurrent affects and ECG recording are again obtained.

The main criterion variables are recurrence of acute infarction and/or sudden death. Biannual survival-mortality information will continue to be determined for a total of five years for each patient.

The data will be organized on the computer to allow for retrieval for analyses of interrelations of single and combinations of the above independent variables with criteria at a given point in time and with patterns of measure changing over time, to test initial hypotheses and to generate new prognostic indices.

QUARTER CENTURY STUDY OF GLUCOSE INTOLERANCE

J.B. O'Sullivan, Boston University, School of Medicine, Dept. of Medicine, *80 E. Concord St., Boston, Massachusetts* 02215 (R01 HL 25149-02)

This is a prospective study of the health consequences of glucose intolerance. Two groups of subjects expected to have highly contrasting rates for cardiovascular disease on the basis of virtual obliteration of the female sex advantage with the development of diabetes mellitus will be studied. The subjects are a group of 685 women with a predefined abnormality of the three hour, 100 gram oral glucose tolerance test (OGTT) and 328 randomly selected negative (i.e., normal OGTT) controls. Initially tests were performed with the natural metabolic stress provided by pregnancy and abnormal tests reverted to normal following delivery. Annual testing followed for most of the intervening years in a longitudinal study that is showing a 17 to 22 year development of diabetes mellitus in less than 5 percent of the controls, and over 40 percent in those initially abnormal with the remainder revealing all grades of evolving diabetes. The unusual opportunity of investigating etiologic clues for cardiovascular complications provided by these contrasting groups that cover the whole spectrum of emerging diabetes will be enhanced by the racial mixture of the study with its 30 percent black component. Current uncertainties concerning the relationship between glucose intolerance and diabetes, on one hand, and its vascular complications, on the other, will be amenable for study.

Response variables will include blood pressures, graded exercise electrocardiograms, peripheral vascular disease by segmental blood pressures using Doppler ultrasonic flow detectors following exercise, peripheral pulse wave contours, pulse rate response to postural change, and a standardized history for angina pectoris, TIAs, intermittent claudication and myocardial infarction. Examination will document congestive heart failure, renal, cerebral and fundoscopic abnormalities. Blood studies will include OGTTs, cholesterol, triglyceride and HDL with detailed quality control procedures. Lipoprotein phenotyping and identification of secondary hyperlipoproteinemics will be included.

APOLIPOPROTEIN PATTERNS IN DIABETES

P.S. Anderson, University of Oklahoma, Health Sciences Center, College of Health, Dept. of Biostatistics & Epidemiology, *Box 26901, Oklahoma City, Oklahoma* 73190 (R01 HL 25124-02)

The major cause of death and morbidity in persons with diabetes mellitus is excessive atherosclerosis. The causes of enhanced rates of atherosclerosis and of medial sclerosis in diabetes are poorly understood. Several lines of evidence suggest strongly that abberations of blood lipoproteins have importance in this regard, but previous data in diabetics are conflicting and incomplete. Particularly lacking in diabetes is information on patterns and distributions of specific apolipoproteins and their relationships to the excessive rates of atherosclerosis. Another problem is that detailed studies of apolipoproteins in diabetics have seldom been attended by detailed data collection in these diabetics on the many concomitants of diabetes that may in themselves influence apolipoproteins and atherogenesis (e.g., obesity, antidiabetic therapy, excessive blood pressure, etc). Data have also been sparse on the relationship of apoprotein status to the vascular status of the diabetics under study.

Local circumstances are particularly propitious because of the availability of both highly-sophisticated competence for ascertaining the status of serum apolipoproteins in detail using recently developed methods, together with epidemiologic resources for determining in each diabetic subject an array of 150 data items that will help greatly in interpreting the blood lipid data. These will include both items potentially important in causing vascular morbidity (e.g., fatness, blood glucose level, etc) and data on manifestations of atherosclerosis (e.g., electrocardiography, foot blood pressure, etc). In a two-year study detailed analyses of blood lipoproteins, and apoproteins will be performed on 200 diabetics and 100 nondiabetics in each of whom comprehensive epidemiologic observations will be performed concerning their status with respect to both diabetes and vascular disease.

27-30 YEAR FOLLOW-UP OF HIGH BLOOD PRESSURE IN CHILDREN

R. Wiittemore, Yale University, School of Medicine, Dept. of Pediatrics, *333 Cedar St., New Haven, Connecticut* 06510 (R01 HL 25115-02)

Approximately 1100 of a cardiac registry of 1700 school children seen 30 years ago were found to have no heart disease, yet careful history, medical examination, height, weight, blood pressure and electrocardiogram were recorded by the present investigator. The objective of this study is to ascertain the significance of these carefully recorded blood pressures taken in childhood with their blood pressure in adult life, 30 years later, and to try to determine potential precursors and risk factors in childhood which may help to identify the potential hypertensive adult.

Slightly over 400 of this population have been re-examined to date but no significant analyses have been performed with the exception that 11.8 percent of the adults examined thus far have high blood pressure at this time (mean age 41.2 years).

CONFERENCE-SODIUM IN CARDIOVASCULAR HYPERTENSION

M.J. Fregly, Monell Chemical Senses Center, *3500 Market St., Philadelphia, Pennsylvania* 19104 (R13 HL 25062-01A1)

The objectives of this conference are the following: (a) to bring together a group of investigators who have contributed consistently to areas related to the role of salt (NaCl) in health and disease; (b) to highlight important problems and critical directions for further study and development; (c) assess the physiological consequences of excessive dietary ingestion of salt; and (d) to publish the results of the symposium so that others either directly or peripherally interested in this subject area will have access to the information. The conference will be organized on a multidisciplinary basis so that a cross-fertilization of ideas and information in the broad area of salt intake in health and disease can occur. The information gained from the conference should be of importance to a broad range of individuals, including practitioners and scientists in medicine, epidemiologists, physiologists, psychologists, food technologists and behavioral scientists.

NOISE AND THE EPIDEMIOLOGY OF HIGH BLOOD PRESSURE

L.H. Kuller, University of Pittsburgh, Graduate School of Public Health, Dept. of Epidemiology, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (R01 HL 25005-01A1)

Urban noise levels have been increasing over time. High levels have been noted in the industrial setting. Several investigations have shown an increased prevalence of high blood pressure among men with prolonged and repeated exposure to industrial noise when compared to a control population.

The major criticisms cited aginst previous research have been: 1) the lack of documentation of intensity and duration of workers' exposure; 2) off-the-job noise exposure has generally not been controlled for; and 3) information on other factors which can affect differences between cases' and controls' blood pressure was not collected.

The primary objective of the present study is to determine whether noise-exposed individuals have an elevation in blood pressure independent of other known risk factors for high blood pressure such as obesity, alcohol intake, etc. The study population will consist of a sample of 250 male hourly workers from a noise-exposed group and 250 hourly workers from a control group. To be eligible for inclusion in the sample, an employee must be between 40 and 60 years old and must have worked at that particular plant for at least ten continuous years. The clinical exam will consist of height, weight, pulse and blood pressure and audiometric evaluation. A detailed questionnaire concerning present and past health status, present smoking habits and current alcohol consumption will be administered. Data on past military history, previous job exposure, hobbies and medication will be obtained. In addition, a battery of psychological tests will be administered to the participants in order to determine the relationship between noise, behavioral changes and blood pressure.

NATURAL HISTORY OF CHRONIC AIRFLOW OBSTRUCTION

A.S. Buist, Oregon State Higher Education System, University of Oregon Health Sciences Center, School of Medicine, Dept. of Medicine/Physiology, *3181 S.W. Sam Jackson Park Rd., Portland, Oregon* 97201 (R01 HL 24918-02)

The proposed work is a continuation of longitudinal studies of three populations in order to (1) determine the predictive value of the single breath N2 test in identifying the individual who is going to progress to chronic airflow obstruction; (2) determine the contribution of various host and environmental factors to the development of chronic airflow obstruction; and (3) obtain further information about how lungs age and what factors affect aging.

The population groups are (1) smokers and non-smokers who were first tested at an emphysema screening center in 1971/72 and subsequently

tested in 1975 and 1977; (2) a random sample of a working population studied in 1974, 1976, and 1978; and (3) parents of 19 children with homozygous alpha1-antitrypsin deficiency studied annually from 1976 to 1978.

Our data base will include (1) information, obtained by questionnaire, relating to respiratory symptoms, smoking habits, chest illnesses, occupation, residence and family history of chest problems; (2) pulmonary function tests; spirometric tests before and after a bronchodilator and the single breath N2 test - a test of small airway function; and (3) trypsin inhibitory capacity and phenotyping for alpha1-antitrypsin deficiency. Subjects will be tested either annually or biennially giving a total follow-up time varying between 8 and 12 years.

DIABETES AND CARDIOVASCULAR RISK IN MEXICAN AMERICANS

M.P. Stern, University of Texas, Health Science Center at San Antonio, Medical School, Dept. of Medicine, *7703 Floyd Curl Dr., San Antonio, Texas* 78284 (R01 HL 24799-02)

The purpose of this research is to study ethnic differences between Mexican Americans and Anglo Americans in prevalence of diabetes, obesity, hypertension, and cardiovascular risk factors, and to relate these differences to sociocultural and lifestyle factors. The specific hypothesis being tested is that 'diabetic pattern' risk factors (glucose intolerance, obesity, hypertriglyceridemia, and low alpha-lipoprotein levels) will decrease in frequency among Mexican Americans as they become acculturated to 'mainstream' U.S. culture. We plan to survey three different target populations in San Antonio: Mexican Americans living in a highly traditional ('barrio') census tract (90% Mexican American); Mexican Americans and Anglos living in a bicultural census tract (50% Mexican American and 50% Anglo); and Mexican Americans and Anglos living in a cluster of suburban census tracts (10% Mexican American and 90% Anglo). We postulate that Mexican Americans living in the 'barrio' will be significantly less acculturated than those living in the bicultural target areas, who in turn will be less acculturated than those living in the suburbs. We will measure level of acculturation, socioeconomic status (SES), and cardiovascular risk factors in all participants.

PSYCHOSOCIAL STRESS IN CORONARY MORTALITY

W. Ruberman, Health Insurance Plan of Greater New York, Dept. of Research & Statistics, *625 Madison Ave., New York, New York* 10022 (R01 HL [illegible].786-02)

This research seeks to assess the role of psychosocial stress in relation to sudden cardiac death among men who have survived a recent myocardial infarction (MI). It has been designed as an ancillary study to The Beta-blocker Heart Attack Trial (BHAT), a large collaborative clinical trial of propranolol among patients with recent MI. Interviews are carried out with the male patients participating in the BHAT trial in 24 of the cooperating clinical centers. These questionnaires provide data to categorize patients by defined aspects of psychosocial stress that serve as variables whose contribution to mortality risk will be assessed. Baseline data covering personal, demographic and clinical characteristics and collected by the Coordinating Center at the University of Texas are to be made available to the ancillary study investigators, and analyses of the psychosocial data will be integrated with this information. The baseline data include the results of ECG monitoring for ventricular arrhythmia for one hour. The hypothesis underlying this effort holds that among MI survivors who manifest complex ventricular premature beats (early, runs, bigeminal or multiform beats) the risk of sudden death is elevated in the presence of relatively high levels of stress.

PSYCHOSOCIAL FACTORS AND CHRONIC DISEASE

J.S. House, University of Michigan, Ann Arbor Campus, School of Public Health, Dept. of Epidemiology, *Ann Arbor, Michigan* 48104 (R01 HL 24545-02)

This project seeks to ascertain the relationship of psychosocial factors to chronic disease, risk factors, morbidity, and mortality through cross-sectional and prospective analyses of data from the Tecumseh Community Health Study. Interview and questionnaire data on psychosocial stress and satisfaction in work, family, and leisure activities will be related to medical examination and interview data collected at the same time (1967-1968) on chronic disease morbidity and risk factors and to mortality over the succeeding decade, through 1978. Controls will be introduced in major analyses for medical examination evidence of health status prior to 1967. Coronary heart disease, hypertension and chronic bronchitis will be focal concerns in cross-sectional analyses of morbidity and risk factors while cardiovascular diseases and cancer will be the major foci of prospective mortality analyses. The analyses will examine not only the direct relationship of work, family, and leisure stress and satisfaction to chronic disease, but also the extent to which these relationships are conditioned or modified, by a variety of individual and social factors (e.g., age, sex, work motivation and involvement, personal habits such as exercise, social support and integration). The relative and joint effects on chronic disease of work and nonwork sources of stress and satisfaction will be assessed.

EPIDEMIOLOGY OF ATHEROSCLEROSIS

B.A. Kottke, Mayo Foundation, *200 1st St. S.W., Rochester, Minnesota* 55901 (R01 HL 24489-02)

Herein is described a genetic epidemiological study of the role of variation in lipoprotein phenotypes and lipid fractions in determining certain forms of atherosclerotic disease. This study will be based on 4,565 individuals in three different sets of pedigrees collected as part of the Rochester SCOR program in atherosclerosis (1971-1977). Pedigrees will be analyzed to provide insight into appropriate intervention strategies. In particular, we shall: l) determine the contribution of genetic and environmental variability to lipid variability within and among families; 2) test for heterogeneity of the genetic and environmental contributions to lipid variability among sets of families identified by probands with different lipid levels, quantitative lipoprotein phenotypes or atherosclerotic disease; 3) search for evidence of segregation at one or more loci with major effects on the lipid phenotype; 4) assess the relative risks of atherosclerotic disease in the adult relatives of different types of probands; and 5) relate sources (shared environment, shared polygenes and/or shared major loci) of familial aggregation of lipid phenotype to the risk of atherosclerotic disease.

3.0852,

CHD INCIDENCE, MORTALITY, RISK FACTOR RELATIONSHIPS

L.T. Kurland, Mayo Foundation, *200 1st St. S.W., Rochester, Minnesota* 55901 (R01 HL 24326-01S1)

Medical care for the population of Olmsted County, Minnesota, is almost entirely provided by the Mayo Clinic and the Olmsted Medical Group and their affiliated hospitals. The records of these institutions and other outside sources have been assembled into a single diagnostic retrieval system and provide a unique resource for population-based epidemiologic studies of serious chronic disease.

Under the Rochester Epidemiologic Program Project (GM 14231), we are now completing a Coronary Heart Disease (CHD) study which will establish the local incidence rates for first manifestations of CHD under the subgroups angina pectoris (AP), myocardial infarction (MI), and sudden unexpected death (SUD) over the period 1950-1975. In that study we have 100% follow-up for five years nd 99.6% follow-up to 1/1/76, a 60% autopsy rate in the AP and MI groups, and 86% in the SUD group. Preliminary date indicate only minor changes in CHD incidence, improved survivorship in AP, and during the last ten years a dramatic decrease in the MI case fatality. In order to obtain a better estimate of the contribution of changing incidence and survivorship to the decreasing mortality rate, we must expand the study from those MIs which are first diagnoses of CHD to all MIs occurring in the local residents. In addition, we propose to extend the coverage from the city of Rochester (current population 55,000) to all of Olmsted County (90,000). Finally, we propose to carry the entire study forward through 1982. Also, all local deaths are being uniformly re-coded to the ICDA 8th revision for the period 1960-1967; this should also be extended to cover 1950-82.

Olmsted County, Minnesota, is an ideal community for the studies proposed, since the medical recodes are of uniform high quality, cover the population of the county with excellent case ascertainment, and are already assembled and retrievable by diagnosis.

LIFE STYLE AND CHRONIC DISEASE IN COLLEGE ALUMNI

R.S. Paffenbarger, Stanford University, School of Medicine, Dept. of Family Community & Preventive Medicine, *300 Pasteur Dr., Stanford, California* 94305 (R01 HL 24133-02)

This epidemiologic study extends observations on 30,000 living former students from Harvard and 13,000 from the University of Pennsylvania to identify patterns of physical activity conducive to the avoidance or delay of hypertensive-arteriosclerotic diseases in middle life. Prospective observations utilize both historical and ongoing perspectives to: l. Identify the type, frequency, duration, and intensity of activities that predispose to reduced risk of first heart attack, stroke, and other cardiovascular diseases primary prevention. 2. Examine changes in physical activity patterns and other key aspects of life style for their relationships to heart attack risk. Patterns of exertion favoring coronary well-being will be studied in successive age group ranging 45-80 years. 3. Test competing hypotheses of benefit, (a) protection vs. selection and (b) average vs. peak levels of energy output. 4. Assess patterns of physical activity associated with prevention of heart attack recurrence and with survival (secondary prevention). 5. Examine sociopsychological and other risk factors for confounding and interacting with physical exercise in relation to heart attack risk; and 6. search for associations between life style and other specific chronic diseases, fatal and nonfatal.

Two-page mail questionnaires are used to log physical activity patterns, social habits, and health status of college alumni. Responses supplement data already compiled from college physical examination and other records (1916-1950) investigative and followup mail questionnaires (1962 or 1966, 1972, 1977 or 1978), and official death certificates (1916-date).

RISK FACTORS FOR MYOCARDIAL INFARCTION IN WOMEN

C.H. Hennekens, Harvard University, Boston Campus, Peter Bent Brigham Hospital, *721 Huntington Ave., Boston, Massachusetts* 02115 (R01 HL 24074-01A1)

This investigation is designed to utilize data from an existing cohort of 120,000 women, aged 30 to 55 in 1976, to study risk factors for myocardial infarction in women. Exposures to oral contraceptives, postmenopausal estrogens and cigarette smoking have been documented, as have menopausal status, a past history of hypertension, diabetes, angina pectoris and hypercholesterolemia, and family history of myocardial infarction. Retrospective data have been collected for the period prior to 1976, and prospective data, including dietary practices, are being collected biennially through 1982. Information is gathered by mail questionnaires, with further documentation of events by review of hospital records.

Simple, stratified and multivariate analyses will all be employed to elucidate the separate relationships of the risk factors with myocardial infarction in women, in both retrospective and prospective data. Interactive effects will be emphasized in both data sets.

SYSTOLIC HYPERTENSION IN THE ELDERLY

L.H. Kuller, University of Pittsburgh, Graduate School of Public Health, Dept. of Epidemiology, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (R01 HL 23924-01A1)

This grant is a request to participate in a multi-center randomized, double blinded clinical trial to determine whether blood pressure lowering therapy reduces the rate of mortality and morbidity from stroke; and secondarily the occurrence of specific nonfatal morbid events, total mortality and cardiovascular mortality in men and women age 60 and older with predominantly systolic hypertension. The basic objectives of this center are: to complete a preliminary study of approximately 30-40 men and women followed for one year to determine the ability to recruit participants, efficacy of reducing systolic hypertension without untoward side effects and maintenance of the population for at least one year. Presuming that this aspect of the protocol will be successfully completed, then the second goal will be to screen and randomize into the trial 400 men and women, train a staff, assist with protocol development and then follow the protocol carefully through the time period of this clinical trial.

SYSTOLIC HYPERTENSION IN THE ELDERLY

H.M. Perry, Washington University, School of Medicine, Dept. of Medicine, *660 S. Euclid Ave., St. Louis, Missouri* 63110 (R01 HL 23917-01A1)

Despite a large body of evidence that systolic hypertension is at least as great a predictor of morbidity and mortality as is diastolic and despite the awareness that systolic hypertension becomes the most common form of blood pressure elevation with age, prospective clinical trials involving lowering of systolic blood pressure by treatment with antihypertensive drugs are very few indeed. These trials and cross-sectional observations that are reported are frequently conflicting. This proposal describes a prospective multicenter clinical trial, involving 11 possible participating clinical centers, a coordinating center, and laboratory and electrocardiographic subcenters, aimed at enrolling 4,200 elderly individuals with primarily systolic hypertension in a five year, prospective, randomized, controlled, double-blind trial of antihypertensive agents (or placebos). The primary objective is to observe each qualifying volunteer for five years, to see whether active treatment of systolic hypertension decreases the incidence of stroke significantly. Secondary end points to be compared are the effect on cardiovascular mortality, incidence of nonfatal myocardial infarcts, the effect of treatment on incidence of cognitive impairment and psychiatric morbidity, and the effect of treatment on incidence of renal failure and congestive heart failure. A pilot phase is included to demonstrate feasibility and to protest all procedures.

Potential participants will be identified by mass blood pressure screening efforts in groups in which there is a large proportion aged 60 and over. Those qualified by screening will be evaluated and, if qualified and willing to give informed consent, randomized and titrated on medication (active or placebo, depending on randomization allocation). Each will then be followed for five full years on maintenance therapy. Evaluation, randomization, titration and maintenance will take place in the clinical facility of each clinical center. It is estimated that 72,000 individuals age 60 and over will have to be screened at each center to get qualified volunteers for randomization. Intake period is estimated at 18 months.

COMMUNITY SURVEILLANCE OF CARDIOVASCULAR DISEASE

H.W. Blackburn, University of Minnesota, Minneapolis Campus, School of Public Health, Laboratory of Physiological Hygiene, *1325 Mayo Memorial, Minneapolis, Minnesota* 55455 (R01 HL 23727-02)

The Minnesota Morbidity and Mortality Surveillance Program has set up mechanisms in its first year of operation to accomplish the following objectives: (a) To continue to monitor Minnesota mortality rates by cause and to begin morbidity measurement to assess the changing burden of cardiovascular disease in the community. (b) To estimate the extent to which changes in mortality rates are related or due to changes in morbidity incidence and/or case fatality rates. (c) To estimate the extent to which changes in mortality rate might be explained by changes in levels of risk factors and their associated behaviors. These mechanisms include the acquisition and analysis of death tapes for the State of Minnesota, the acquisition and analysis of hospital discharge tapes for the 7-county surveillance area with validation of a 10% sample of discharge diagnoses by medical records, the survey of a representative sample of 2000 subjects annually from the 7-county area. Surveillance will be continued through 1984. Data will be analyzed to attain the above listed objectives.

PAWTUCKET HEART HEALTH PROGRAM

R.A. Carleton, Memorial Hospital, Section of Medicine, *Prospect & Pond Sts., Pawtucket, Rhode Island* 02860 (R01 HL 23629-01A1)

Many atherosclerosis risk factors relate closely to individual behavior. Individual behavior reflects personal choices for behavior as modified by a complex set of factors both in the immediate environment and in the cultural environment of the person. This proposal is for a research program with an intervention and a comparison city. The intervention city will have an opportunity for citizens to participate actively through a penetrating community organizatıcn effort based upon the normative systems model. This community activation effort for health culture change will be aided by media and by research development of new strategies for individual behavior change. It will work with and through all major groups and organizations within the community including schools, government, labor, industry, churches, etc.

The effectiveness of the process itself will be evaluated carefully. Short-term, mid-term, and long-term evaluation will include measuring outcomes of individual program components, survey for changes in physiologic variables such as serum cholesterol, and ongoing surveillance of morbidity and mortality in the intervention and comparison cities.

The overall objective is to produce a significant reduction in morbidity and mortality from coronary heart disease and stroke. Equally importantly, the program aims to induce a cultural change process which will persist long after funding for research and development has ceased.

LIFE CHANGE STRESS AND SOMATIZATION IN HYPERTENSION

H.F. Myers, Charles R. Drew Postgraduate Medical School, School of Medicine, Dept. of Human Behavior & Psychiatry, *1621 E. 120th St., Los Angeles, California* 90059 (R23 HL 23522-02)

Essential hypertension has been recognized as a major health problem in the United States, with particular impact on blacks, the poor and on women. The present study addresses the role that stressful life change events, subjective appraisal and somatic response patterns play in essential hypertension. The study specifically addresses the following objectives: (1) to determine whether stressful life change events are positively related to and account for a significant proportion of variation in blood pressure; (2) whether subjective appraisal of stress affects blood pressure singly or in interaction with the objective measure of stressful events; (3) to determine whether variations in blood pressure are positively correlated with distinct patterns of somatic response patterns especially a cardio-respiratory response tendency, and finally; (4) whether personal and familial history of cardiovascular difficulties and other socio-demographic factors such as sex, age and race contribute to explaining variation in blood pressure.

The study is designed as a survey study with a random sample of 300 adults, ages 21-65. These subjects will be paid volunteers who will undergo a 1 hour private interview in their homes during which time four blood pressure readings will be taken and a composite questionnaire with scales measuring the predictor variables will be administered. The degree of relationship between the predictor variables (i.e., correlations) and the extent to which they contribute singly or in consort to the proportion of explained variation in blood pressure (i.e., multiple regression analysis) will be ascertained.

CHILDHOOD HYPERTENSION - RENIN, URATE, EPIDEMIOLOGY

A.B. Gruskin, St. Christophers Hospital for Children, *2600 N. Lawrence St., Philadelphia, Pennsylvania* 19133 (R01 HL 23511-02)

This study aims to develop the concept of renin profiling in children and adolescents primarily with hypertension. Results obtained in hypertensive children are currently being compared to values developed in normal volunteers. The renin response to acute volume contraction and three days of a low salt diet is currently under investigation. Simultaneously the incidence of hyperuricemia and its mechanism are being evaluated. To date, uric acid metabolism has been evaluated in approximately 50 hypertensive children. Thirty to forty percent have had uric acid abnormalities. Also, it has been shown that the presence of hyperuricemia alters the renal response to the oral administration of a diuretic. The data developed in some of these children are also being added to data already available in these children who have participated in one of the National Heart, Lung & Blood Institute's studies entitled 'Antecedents of Adolescent Hypertension.'

GENETICS OF HYPERTENSION AND ASSOCIATED VARIABLES

R.M. Siervogel, Wright State University, School of Medicine, Dept. of Pediatrics, *Colonel Glenn Hwy., Dayton, Ohio* 45431 (R01 HL 23194-04)

High blood pressure, including essential hypertension, is a major risk factor of stroke, congestive heart failure, coronary heart disease and other cardiovascular diseases. The identification and study of childhood precursors of hypertension which could lead to methods effective in the prevention of adult hypertension is a major goal of this study. Considerable evidence suggests that heredity plays a large and important role in determining blood pressure, particularly as it relates to essential hypertension. In the proposed study, the mode of inheritance of genes involved with blood pressure regulation and associated variables will be investigated with an aim to providing information relevant to the genetic epidemiology of hypertension. Particular attention will be paid to a search for major genes by using recently developed statistical methods designed for segregation and linkage analysis of quantitative traits in large pedigrees.

Five large (75-350 members) families have been ascertained, each through a proband with essential hypertension; four of these families are White and one is Black. Most members participated in an extensive data collection protocol involving variables of an anthropometric, biochemical, genetic, medical, physiological, psychological and sociological nature. Among the measured variables are: subcutaneous fat thicknesses; plasma lipid, lipoprotein and renin levels; urinary kallikrein and aldosterone levels; genetic markers; physical examination and clinical laboratory findings; systolic time intervals in response to numerous stresses; personality assessments; and socioeconomic status.

The identification of genetic effects including major gene influences may help define important epidemiologic factors that: 1) relate to increased risk of hypertension; 2) account for differences in blood pressure among various subgroups of the population; 3) can identify children that have high risk for developing hypertension; 4) can identify homogeneous groups for further study of disease etiology.

PSYCHOSOCIAL STRESS AND SUDDEN CORONARY DEATH

W. Ruberman, Health Insurance Plan of Greater New York, *625 Madison Ave., New York, New York* 10022 (R01 HL 23078-03)

This research seeks to study a large differential in risk of sudden coronary death that has been found among men of relatively low and high educational levels. The setting is a prospective study of men with coronary heart disease among a population of 120,000 men aged 35-74, insured for medical care in New York City (Health Insurance Plan of Greater New York --HIP). Among a cohort of 1,739 men with prior myocardial infarction (MI), those demonstrating complex ventricular premature beats (VPB) in one hour of ECG monitoring show a cumulative probability of sudden coronary death, over a 5-year period, that is more than twice that experienced by the men free of such VPB. Further, among the men demonstrating complex VPB (early, runs, bigeminal or multiform VPB) in one hour, the least educated men are apparently at more than twice the risk for sudden coronary death shown by those with more than eight years of schooling.

The finding with respect to education is not explained by associations with a large number of other variables. This study will examine whether low education reflects a relatively high level of life-situation factors which, given the presence of complex VPB, may trigger the lethal arrhythmia mechanism. Information to characterize the MI patients is being obtained through a telephone interview of spouses of all patients -- both living and dead -- in the original HIP study of VPB and sudden death. Analyses of the interview data will be directed to classification of broad levels of psychosocial stress. Such categories will then be examined as one or more prognostic variables in assessing risk of sudden coronary death controlling for all other important factors. The existence of an extensive body of prognostic information about the large cohort of post-MI men provides an important resource in the analysis of the new psychosocial data.

MULTICENTER POSTCORONARY RISK STRATIFICATION PROGRAM

A.J. Moss, University of Rochester, School of Medicine & Dentistry, Dept. of Preventive Medicine & Community Health, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (R01 HL 22982-03)

The proposed research is a multicenter prospective study to develop and validate widely applicable criteria for stratifying risk of cardiac death in the year following acute myocardial infarction. A homogeneous population (acute myocardial infarction) derived from a heterogeneous group of hospitals (university and community) widely dispersed in geography (New York, St. Louis, Rochester) will be studied to permit generalization of the results to the whole population at risk. Three special studies have been included in the clinical evaluation of the postinfarction population prior to hospital discharge: radionuclide ejection fractions for quantitative evaluation of left ventricular function, 24-hour Holter ECG tape recordings for the precise quantitation of the degree of electrical instability, and limited activity tests to assess overall cardiovascular function and the presence of activity-related myocardia ischemia.

Approximately 1000 patients who survive the early hospital phase of an acute myocardial infarction will be entered during a 24-month enrollment period. Routine clinical evaluation and special studies will be performed prior to hospital discharge. All patients will be followed for a minimum of one year with clinical follow-up evaluation at 3, 6 and 12 months. A standard Bruce-protocol exercise will be obtained at the three month follow-up visit. The main thrust of the data analysis are: 1) to identify functional risk variables which can be widely applied to risk stratification in postinfarction patients; 2) to elucidate pathophysiologic mechanisms responsible for survival and cardiac death by uncovering interactions and associations among the risk indicators; 3) to critically evaluate existing clinical concepts involving postinfarction patients by testing a priori hypotheses on this prospective population; 4) to characterize current patterns of therapy in postinfarction patients to improve background information for the design of future therapeutic intervention trials, and 5) to classify mortality events carefully as to chronology, cause and preventability.

EPIDEMIOLOGICAL STUDY OF ATHEROSCLEROSIS IN EVANS COUNTY

C.G. Hames, Evans County Dept. of Health, *2 N. Newton St., Claxton, Georgia* 30417 (R01 HL 03341-24)

Continue the surveillance of morbidity and mortality, including all clinical cardiovascular and cerebrovascular events; i.e., transitory ischemia, CVA, myocardial infarction along with the collection of pathological specimens and other necropsy data where possible, of all cohort study groups in the Evans County Studies; i.e., a) 1200 participants in NHLI lipoprotein phenotyping study; b) 1,000 black-white neonatal blood pressure study participants; c) 600 stepped vs. regular care participants in the NHLI-HDFP study; d) approximately 1,800 participants of the original 1960 Evans County Study cohort; e) 1,000 oral contraceptive users vs. 1,000 age, race matched non-oral contraceptive users; f) 650 Blacks and Whites typed of G6PD deficiency A, A (-) and B. Correlate the above parameters under study with morbidity and mortality; i.e. a) spectrum of Alpha-beta lipoprotein fractions with morbidity and mortality; b) blood pressure levels during the first year of life as a predictor of subsequent hypertension; c) compare Evans County neonatal black-white blood pressure levels with comparable groups in other geographical areas; i.e. genetic vs. environmental? d) determine differences, if any, in the 5 year survival of stepped care vs. regular hypertensive care in the NLHI Evans County Hyper-

tension Detection and Follow-up Program; e) determine if kallikrein levels, heparin neutralizing activity or estrogen levels are related to morbidity and mortality in black-white oral contraceptive users vs. non-oral contraceptive users. Continue to utilize the already defined as well as new biracial pedigree cohorts for genetic models to study the possible inheritance of hypertension and hyperlipidemias. Maintain the study as a population laboratory for the Dept. of Epidemiology, School of Public Health, Univ. of North Carolina; Duke University; Medical Univ. of S.C. and other collaborative institutions in which to explore the association between the observed CHD and hypertension in the Evans County study population and new untested specific epidemiological correlates. Continue to assemble and maintain all data collected or to be collected including the frozen sera and food collection and make available for maximum utilization by qualified individuals and institutions for teaching and research. To evaluate the capacit (Text Truncated - Exceeds Capacity)

CONGENITAL HEART DISEASE RESEARCH PROGRAM

M. Lev, Hektoen Inst. for Medical Research, Congenital Heart Disease Research & Training Center, *627 S. Wood St., Chicago, Illinois* 60612 (R01 HL 07605-18)

We will continue our studies of sudden death occurring a long time after surgery by studies of the conduction system. We will continue our studies of unexpected sudden death in otherwise clinically healthy young people by similar conduction system studies. We will continue our studies of congenital heart block by conduction system studies and of WPW by serial section studies of both AV rims and the conduction system. We will study the conduction system and its nerve supply in atrial arrhythmias. We will study the pathology of the summit of the ventricular septum in the aged and relate this to electrocardiographic and conduction system studies. We will continue to describe and study the congenitally abnormal hearts of the Chicago area. We will codify all our congenital hearts seen in the last 20 years and synthesize them into a book. We will initiate the study of the histology of the coronary arteries in congenital heart disease. We will study the relative incidence of various types of congenital heart disease in our material in the last twenty years.

NATURAL AND EXPERIMENTAL ATHEROSCLEROSIS

J.P. Strong, Louisiana State University, Medical Center, School of Medicine, Dept. of Pathology, *1542 Tulane Ave., New Orleans, Louisiana* 70112 (P01 HL 08974-16)

The ultimate objective of this research is to determine the etiology and pathogenesis of atherosclerosis and its sequelae. This objective is approached by combining morphologic, experimental, epidemiologic, chemical, immunochemical, cytologic and biometric methods. The possible etiologic relationships of certain environmental factors and disease states to arterial lesions, coronary heart disease and sudden death are being studied using a community pathology approach. This study of a 100 percent sample of deceased men, 24-44 years of age, from the biracial community of New Orleans includes a detailed examination of the heart, coronary arteries, and the postmortem characteristics of the 80 percent of deaths which are autopsied. An explanation for an apparent anomalous difference in coronary heart disease in young Negro and Caucasian men is being sought. Experimental studies in nonhuman primates are being used to study the mechanisms of development and regression of diet-induced arterial lesions. Factors causing variability in rate of development or regression of diet-induced atherosclerotic lesions are being studied. Cholesterol and lipoprotein metabolism is also being investigated in primate animals to obtain an understanding of the mechanisms responsible for the large differences in serum cholesterol or lipoprotein concentrations among animals. Archived coronary arteries, aortas, and associated clinical data obtained from 24,000 autopsies from 19 geographic and racial groups are being used to obtain a better understanding of the natural history of human atherosclerosis and its geographic distribution.

PULMONARY SCOR - AIRWAYS OBSTRUCTIVE DISEASES

B. Burrows, University of Arizona, School of Medicine, Dept. of Internal Medicine, *1501 N. Campbell Ave., Tucson, Arizona* 85721 (P50 HL 14136-09)

The work proposed is directed toward meeting the objectives of the Arizona SCOR, i.e., to elucidate the pathogeneses, pathophysiology, natural histories and factors contributing to the development of airway obstructive diseases (AOD) in order to prevent, detect, and/or treat AOD. To accomplish this, eight closely related projects, supported by Core units, comprise a multidisciplinary program involving and combining epidemiological, clinical, pathophysiological, experimental, and radiological approaches to the AOD problem. The prospective longitudinal epidemiological survey of the 4,000 members of 1,650 Tucson households will continue to study the role of smoking, environmental, host, and genetic factors, including atopy, asthma, and history of bronchiolitis or other childhood respiratory illness, in contributing to the risk of developing chronic bronchitis, emphysema, or other chronic obstructive pulmonary disease (COPD), and provide further opportunity to evaluate methods for early detection of subclinical COPD. Air versus helium oxygen flow-volume curves and chest radiographs will be evaluated in this context. In subpopulations, there are specific studies of the role of air pollutants, aeroallergens, atopy and IgE levels, airway reactivity, or alpha -1- antitrypsin Pi MZ phenotype in the development of AOD. Pediatric lung function tests are being developed and will be utilized to study childhood airways diseases and their long-term consequences. Experimental studies are being employed to relate structure to function in animals, in excised lung preparations, and human autopsy material, combining physiological measurements with simultaneous roentgenographic image magnification and subsequent morphometry. Refinements of high resolution radiologic imaging will continue.

JOHNS HOPKINS LUNG CENTER SUPPORT - CHRONIC DISEASES OF AIRWAYS

H.A. Menkes, Johns Hopkins University, School of Medicine, Dept. of Medicine & Environmental Health Sciences, *725 N. Wolfe St., Baltimore, Maryland* 21205 (P50 HL 14153-09)

In the development of chronic obstructive pulmonary disease (COPD) there is a transition period when the individual is asymptomatic and the physician is unaware of the disorder. The present SCOR program includes a collaborative multidisciplinary approach to the study of obstructive lung disease especially during its earliest stages. In the first section of the program epidemiologic and physiologic approaches are applied to investigate the etiology, risk factors, and the natural history of airways obstruction. In the second section, immunologic and physiologic approaches are used to study acute reactions of the airways and their relation to chronic disease. In the third section, pathologic and physiclogic approaches are applied to evaluate chronic reactions in the development of airways obstruction. Our goal is to characterize the individual at risk for COPD. With that knowledge, it may be possible to introduce effective modes of intervention.

A/S SCOR - LIPIDS, ATHEROSCLEROSIS AND THROMBOSIS

A.A. Spector, University of Iowa, School of Medicine, Dept. of Internal Medicine, *Jessup Hall, Iowa City, Iowa* 52240 (P50 HL 14230-10)

This is a multidisciplinary research project having a goal of elucidating basic biochemical and pathological mechanisms responsible for arteriosclerotic cardiovascular disease. It is made up of six research projects and three Core laboratories. Project 1 deals with the effect of membrane lipid modification on cell function as well as the regulation of cholesterol and fatty acid biosynthesis in leukocytes. Project 2 deals with the development and regression of atherosclerosis in a primate model. Project 3 deals with the function of human endothelial cells and the interaction between endotheiial cells and platelets. Project 4 deals with plasma clotting factors, particularly factor VIII, thrombin, heparin cofactor and the binding of thrombin to cultured endothelial cells. Another aspect of this project deals with the properties of endothelial cells derived from mouse brain blood vessels. Project 5 is a clinical epidemiological project on coronary risk factors in school children. Project 6 concerns the role of lysosomal enzymes in atherosclerosis, with particular attention given to cholesteryl ester hydrolase. These projects are supported by Core laboratories.

A/S SCOR--EARLY NATURAL HISTORY OF ARTERIOSCLEROSIS

G.S. Berenson, Louisiana State University, Medical Center, School of Medicine, Dept. of Medicine, *1542 Tulane Ave., New Orleans, Louisiana* 70112 (P50 HL 15103-09)

The SCOR-A program concerns the Early Natural History of Atherosclerosis and Essential Hypertension and includes both clinical and experimental research. The clinical research is studying 5,000 children in a well defined biracial population for cardiovascular risk factor variables, to determine the distribution and prevalence, interrelationship, and time-course changes of the risk factors. Serum lipids and lipoproteins, blood pressure, selected anthropometric measurements, and other variables - tobacco usage and fasting blood glucose and insulin - are under study. The epidemiologic design provides cross-sectional and longitudinal observations since changes over time are critical aspects of the program in an effort to predict future hypertension and hyperlipoproteinemia and the occurrence of multi-risk factors. 'Tracking' of the risk factor data is noted and indicates the merit of studying cardiovascular risk at an early age. Special sub-studies related to hypertension and hyperlipoproteinemia show racial differences which have implications for underlying biological mechanisms contributing to levels of risk factors.

The experimental research includes nutrition studies on non-human primates to develop models of hypertension and hyperlipoproteinemia. high sucrose intake has resulted in an exaggeration of the effect of exogenous cholesterol on serum lipoproteins and on a salt induced hypertension. The chemistry of the arterial wall is also being studied to explore the role of proteoglycans in atherosclerosis and the biological properties of these macromolecules.

VERMONT LUNG CENTER

J.E. Craighead, University of Vermont & State Agricultural College, School of Medicine, Dept. of Medicine, *85 S. Prospect St., Burlington, Vermont* 05401 (P60 HL 17292-05)

The Vermont Lung Center has as its major objectives: 1. The integration into a cohesive operational system of existing lung programs in research, education, clinical demonstration, and regional disease management, including dissemination of information and technical assistance, health statistics and prevention and control. 2. Interdisciplinary study, prevention and control of pneumoconiosis. 3. Research in the pathology and management of acute pulmonary trauma, in basic methodology of computer-assisted instruction in pulmonary physiology in the pathology, pathogenesis, biochemistry, immunology, and cell physiology of diffuse interstitial lung disease (Vermont SCOR). 4. Clinical demonstration and rapid application of new research findings in lung disease using the Problem Oriented Medical Information System (PROMIS). 5. Regional management of specified lung disease problems utilizing an inter-hospital computer network. 6. Graduate and post-graduate education using audio-visual aids and regional interactive television. 7. Public education and information geared to lung disease problems specified by the regional Lung Disease Management Committee. 8. Provision of a broadly based, multi-disciplinary Training Environment for undergraduate, graduate and post-graduate scientists, physicians, nurses, and allied health professionals in the various facets of research, clinical practice, teaching and continuing education in the biology of the lung, disease of the lung, and health care management of categorical problems related to the lung.

THE IMPACT OF STRESS ON CORONARY HEART DISEASE

M.J. Horowitz, University of California, San Francisco Campus, Langley Porter Neuropsychiatric Inst., *401 Parnassus Ave., San Francisco, California* 94122 (R01 HL 17580-06)

The objective of this study is to determine whether groups of men aged 35-57 exposed to higher-than-usual frequencies of potentially stressful life events tend to have higher death rates, higher rates of coronary heart disease, and higher blood pressure levels and smoking rates, than a comparable contrast group with less exposure to stressful life events. In addition, the study aims to determine whether stressful life events are imposed in an individual as a result of being identified as high risk for coronary heart disease. That is, does the process of being informed of one's risk and, as a consequence, being asked to take preventive measures such as changing diet and smoking behaviors, losing weight, and taking medication for hypertension, operate as a specific stress factor and influence mortality?

BIBLIOGRAPHIC REFERENCES: Horowitz M, Hulley S, Alvarez W, Reynolds A, Benfari R, Blair S, Borhani N, Simon N: Life events, risk factors, and coronary disease. Psychosomatics 20, 586-592, 1979.

ISCHEMIC HEART DISEASE SPECIALIZED CENTER OF RESEARCH

R.A. Rosati, Duke University, School of Medicine, Dept. of Medicine, *Box 3711, Durham, North Carolina* 27710 (P50 HL 17670-06)

The Duke University Medical Center Ischemic Heart Disease Specialized Center of Research, a multidisciplinary, interdepartmental clinical and fundamental research program, is directed at the reduction of death and disability from ischemic heart disease. The program involves scientists and physicians in the departments of Community and Family Medicine, Medicine, Pathology, Pharmacology, Physiology, Radiology, and Surgery. The clinical component encompasses research into each of the major manifestations of ischemic heart disease: acute myocardial infarction, angina pectoris, congestive heart failure, ischemic heart disease in the absence of significant coronary artery disease, refractory arrhythmias, and sudden death. The fundamental component encompasses research into the pathophysiology of the ischemic process and its effects on the pharmacologic action of therpeutic agents. The total effort is targeted at translating the results of research concerning the pathophysiology, diagnostic and prognostic evaluation, medical and surgical therapy, and rehabilitation and secondary prevention of ischemic heart disease into the clinical arena to reduce death and disability from IHD.

HYPERTENSION CENTER - SCOR

J.H. Laragh, Cornell University, Medical Center, Cornell Medical College, Dept. of Medicine, *1300 York Ave., New York, New York* 10021 (P50 HL 18323-06)

Continued support is requested for a hypertension research program based on identifying and typing heterogeneity among hypertensive patients using endocrine profiles related to electrolyte metabolism. These profiles are applied to analysis of associated clinical and physiologic characteristics for understanding causal mechanisms and for development of new and more specific treatments. Recent developments make it possible to subclassify the 'essential' hypertension population on the basis of definable abnormalities in the renin-angiotensin-aldosterone system, separating patients first in terms of abnormalities in renin secretion and then subdividing them according to variations gleaned from detailed metabolic ward studies to out-patients for more detailed in-patients. The out-patient center in turn is a source of characterized patients for more detailed in-patient study. Using hormonal profiling, longitudinal analysis has suggested differences in mechanisms, clinical course and prognosis in patients with essential hypertension. These suggestions will be pursued prospectively with larger numbers. Also, our experience indicates that in exposing hormonal deviations among the endocrine subgroups derived from the initial renin-sodium index it is then possible to develop new simpler treatments directed specifically against the hormonal deviation, or the lesion to which it points. Within the renin subgroups, clearer definition of heterogeneity will be accomplished by in-depth association of endocrine profiles with physiological, hemodynamic and pharmacologic characteristics. Attention will be given to volume/vasoconstrictor and related mechanisms in those subgroups refractory to treatment. The program will be expanded to pediatric patients and industrial populations and to include nephric and anephric patients with end-stage kidney disease. Clinical studies will be supported by new biochemical studies of renin system components, and of autonomic and other steroid hormones. Parallel studies in animal models and of other relevant human disorders will serve to validate the clinical findings. Computer systems will be used for data collection and analysis and also to test our model of hormonal and circulatory behavior which is used as a conceptual focus.

CARDIOVASCULAR FOLLOW-UP OF HYPERTENSIVE ADOLESCENTS

D.E. Fixler, University of Texas, Health Science Center at Dallas, Southwestern Medical School, Dept. of Pediatrics, *5323 Harry Hines Blvd., Dallas, Texas* 75230 (R01 HL 18456-05)

The natural history of the pubescent child with blood pressures at or above the upper limits of normal has not been well defined. The purpose of this study is fourfold: 1) to determine the prevalence of hypertensive cardiovascular changes during adolescence; 2) to determine if the normal rise in blood pressures seen during puberty is related to sexual development; 3) to determine if the increased prevalence of hypertension in blacks becomes evident in adolescence; 4) to determine if exercise stress testing identifies those who are prone to develop hypertension. All eighth-grade children in the Dallas Independent School District currently have blood pressures recorded by school nurses. Eight hundred adolescents will be grouped according to stage of sexual development. Children having systolic or diastolic blood pressures in the upper 5th percentile will be recalled for repeat blood pressure determinations. Those with all three determinations the first year in the upper 5th percentile (and an equal number of controls) will have echo and vectorcardiograms to determine left ventricular hypertrophy, and some will have exercise stress tests to evaluate cardiac performance, i.e., echocardiographic determination of ejection fraction, pre-ejection period, ejection time and circumferential fiber shortening velocity. Blood pressures will be recorded semi-annually, and echocardiographic and vectorcardiographic studies annually. All patients in the initial follow-up group and the control students will be followed throughout the five-year period. All students will be rescreened bi-annually when in the tenth and twelfth grades. Blood pressure response to exercise stress testing and the echocardiographic and vectorcardiographic findings will provide data to determine the prevalence of hypertensive myocardial changes in adolescent children.

THE DETERMINANTS OF RISK OF SUDDEN DEATH

L.E. Hinkle, Cornell University Medical Center, Cornell Medical College, Dept. of Medicine, *1300 York Ave., New York, New York* 10021 (R01 HL 18776-06)

We have completed 1019 5 year prospective observations of men aged 40-65 with repeated (1-7 times) comprehensive medical histories and examinations; reviews of activities, medications, smoking, drinking, and time budgets; blood lipids, glucose tolerance, serum uric acid and biochemical and hematological profiles; chest x-rays; twelve lead ECS; and 24 hour recordings of ECG; plus investigations of all illnesses and deaths (total 140) that occurred. 'Arrhythmic deaths' manifested by the sudden cessation of the heart beat at a time when the pumping action of the heart was preserved were 56% of all deaths and 92% of deaths that were primarily attributable to heart disease in the random samples. 69% of the acute illnesses that terminated in arrhythmic death lasted less than one hour. 72% of arrhythmic deaths occurred outside the hospital.

One or more disorders of the myocardium were definitely or very probably present prior to 92% of the arrhythmic deaths. Major chronic disorders of heart rate, rhythm or conduction were present at the last examination shortly prior to 85% of the arrhythmic deaths. Significant increases in the clinical evidence of myocardial disease occurred acutely or sub-acutely during a period of hours, days or weeks prior to the occurrence of 50% of the arrhythmic deaths; and in addition 24% of the autopsied arrhythmic deaths occurred in the presences of a 'silent' acute myocardial infarction or coronary occlusion. At least 65% of the arrhythmic deaths occurred to men who were awake at the time. From a study of tape recordings, four mechanisms have been identified as precipitating potentially fatal arrhythmias in subjects who subsequently died under circumstances in which such mechanisms may well have been operating.

We are preparing to analyse prospectively 12 major categories of variables as risk factors for the occurrence of sudden arrhythmic death and new events of non-fatal heart disease.

GENETIC EPIDEMIOLOGY OF PRECURSORS OF HYPERTENSION

R.H. Ward, University of British Columbia, *6174 University Blvd., #300, Vancouver, British Columbia, Canada* V6T 1W5 (R01 HL 26869-01)

This collaborative longitudinal study is designed to identify factors which cause increase in blood pressure, lipid levels, obesity, and other risk factors in cardiovascular disease in a migrant Polynesian population. The proposed research aims to elucidate the role played by genetic and familial factors in mediating the response of the migrants to their new environment.

The Tokelau Island Migrant Study is an epidemiologically based investigation of the changes in the physical and socio-cultural environment that are associated with increased risk of cardiovascular disease, as Tokelauans migrate from their traditional atolls to New Zealand. Starting in 1968 with a survey of the premigrant population, the study has accumulated information on the non-migrants and migrants with further surveys being planned for 1980/81.

This application is concerned with the genetic component underlying the response to the 'h-risk' environment by increased blood pressure, lipid levels, glucose levels and obesity in adults and the precursors of the changes in children. Our previous research has demonstrates that genetic factors are important in the familial aggregation of blood pressure, lipids, serum glucose for both children and adults in the premigrant, non-migrant, and migrant populations. By developing response scores for the 75/77 and 80/81 surveys, standardized by identified concomitant variables, we aim to identify the genetic attributes of 'response' using likelihood analysis of pedigree data. We will also estimate the contribution of sociological factors to the common familial environment and will investigate the familial and genetic contribution to tracking of blood pressure scores over the 10-year period. Finally, we aim to identify high risk families and evaluate the predictive value of risk-discriminant functions derived from the 75/77 data by testing against the 80/81 data.

EPIDEMIOLOGY OF HORMONES AND LIPOPROTEINS

L.H. Kuller, University of Pittsburgh, Graduate School of Public Health, Dept. of Epidemiology, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (R01 HL 26757-01)

In our previous study we have demonstrated the direct relationship between the level of free and bound testosterone in plasma and HDLc. The association persisted after adjustment for age, cigarette smoking, alcohol consumption and obesity. Physical activity did not appear to be related to HDLc in this population because of the relatively sedentary status. We propose to re-evaluate the same participants two years later and again determine the relationship between hormones, the risk factors, and lipoprotein cholesterol. Measurement of both testosterone and estrogen will be done. A replication of our previous findings are necessary prior to doing more detailed lipoprotein and hormone studies. The men participating in this study are part of the Multiple Risk Factor Intervention Trial (MRFIT) cohort, and will be re-examined at their sixth annual examination. The cost of the study will be modest since most of the information is collected as part of the MRFIT study.

THYROID AND PARATHYROID HORMONES IN HYPERTENSION

D.H. Streeten, State University of New York, Upstate Medical Center, School of Medicine, Dept. of Medicine, *766 Irving Ave., Syracuse, New York* 13210 (R01 HL 26748-01)

Past evidence derived both from reports in the literature and from the Investigators' observations have shown that hypothyroidism and hyperparathyroidism may be associated with hypertension in man, which usually disappears with correction of the thyroid or parathyroid disorder. Since the incidences of these endocrine causes of hypertension are not known, these will be defined by screening patients with hypertension prospectively over 5 years for demonstrable hypothyroidism and hyperparathyroidism. The mechanism of each type of hypertension will be defined by metabolic studies aimed at determining whether the hypertension is of the high-, normal- or low-renin type, whether it is angiotensin-dependent (reversed by saralasin), whether it is mediated by hyperaldosteronism (associated with hyperaldosteronism unsuppressible with standardized saline infusions and is overcome by spironolactone therapy), whether it is mediated by catecholamine excess (associated with elevated plasma catecholamines and overcome by phentolamine), whether it is hypervolemic and volume dependent (associated with expanded plasma volume and reversed by venesection) and whether it is associated with abnormalities in blood bradykinin level or in urinary prostaglandin E2 excretion.

TYPE A BEHAVIOR AND OCCUPATIONAL ROLES OF WOMEN

P.L. Pirie, University of Minnesota, Minneapolis Campus, School of Public Health, Laboratory of Physiological Hygiene, *1325 Mayo Memorial, Minneapolis, Minnesota* 55455 (R01 HL 26684-01)

Evidence has been produced linking the coronary-prone behavior pattern with the later development of coronary heart disease in men and women. The coronary prone behavior pattern is often described in terms of work related characteristics, and research has shown increased coronary prone behavior among males in certain occupations.

However, coronary heart disease is a major cause of death among women as well. Furthermore, women's occupational roles have changed in the past decade. Many women are now exposed to the same occupational demands and challenges faced by men. In light of this development, it has become important to explore the coronary prone behavior pattern in women. The proposed research will take advantage of an ongoing survey of adult urban residents to assess the relationship between coronary prone behavior and characteristics of women's occupational roles. Occupational variables of interest include employment status, prestige of occupation, and whether the occupation is traditionally filled by males or females.

PATHOLOGY OF CARDIOMYOPATHIES - A PROSPECTIVE STUDY

J.J. Fenoglio, Columbia University, College of Physicians & Surgeons, Dept. of Pathology, *630 W. 168th St., New York, New York* 10032 (R01 HL 26588-01)

The objectives of this proposal are to determine if chronic myocarditis and intramyocardial coronary artery disease are specific disease entities and to determine whether a relationship exists between these disease states and congestive cardiomyopathy. We will define the pathology and natural history of chronic myocarditis and intramyocardial coronary artery disease with the aid of endomyocardial biopsy. Endomyocardial biopsy is part of the routine diagnostic procedure for patients with cardiac disease of undetermined etiology. Patients with chronic myocarditis will be diagnosed histologically and then included in a clinical study in process in the hospital. These patients will be rebiopsied at 1 month, 7 month and yearly intervals after diagnosis under the clinical study protocol. Patients with chronic myocarditis will be treated with steroids on a randomized basis. No patient will be biopsied solely for purposes of this proposal. We will do detailed histologic, ultrastructural and viral studies on each biopsy. We will determine whether the inflammatory process in chronic myocarditis is ongoing and results in cardiac fibrosis? If it is related to viruses and if it can be arrested by steroid therapy? Patients with intramyocardial coronary artery disease will be identified histologically. These patients will be evaluated and followed in depth but no specific treatment will be instituted. We will do detailed structural studies on the initial biopsy and any subsequent biopsy done for clinical indications. No patient will be biopsied solely for purposes of the proposal. We will characterize the vascular lesions and determine if a specific vascular lesion is associated with the clinical development of so-called ischemic or diabetic cardiomyopathy. These studies will provide new insights into the pathology and natural history of chronic myocarditis and small vessel disease and determine if these entities are related to the development of cardiomyopathy.

BLOOD PRESSURE AND LUNG FUNCTION IN ADULT TWIN FAMILIES

F.I. Lewitter, Harvard University, Boston Campus, Peter Bent Brigham Hospital, *721 Huntington Ave., Boston, Massachusetts* 02115 (R01 HL 26491-01)

The proposed study involves the establishment of a large cohort of fertile adult twins ascertained through their offspring by a survey of collaborating school systems. The 300 twin pairs - 100 monozygotic (MZ) females, 50 MZ males, 100 dizygotic (DZ) females and 50 DZ males - their spouses and offspring will be included in studies of blood pressure and pulmonary function. Specifically, the study is designed to assess some of the environmental and genetic components of variance of these physiological measures, both of which are importantly related to chronic diseases in aging populations. Families of adult twins contain all of the necessary genetic and environmental relationships to accomplish this goal. An iterative weighted least squares analysis is used to identify relevant sources of genetic (additive, dominance, etc.), environmental (within-sibships, among sibships, etc.), and maternal effects, if they exist. Further intensive study and manipulation of these identifiable sources of environmental variation may lead to the eventual anticipation or prevention of the disease state.

PHYSICAL ACTIVITY AND PRIMARY CARDIAC ARREST

D.R. Peterson, University of Washington, School of Public Health & Community Medicine, Dept. of Epidemiology, *4000 15th Ave. N.E., Seattle, Washington* 98105 (R01 HL 26208-01)

The primary purpose of the proposed study is to demonstrate the relationship between leisure-time physical activity and primary cardiac arrest (PCA) in an ambulatory population without previous clinical cardiovascular disease. The research will address a question of particular interest to clinicians, cardiovascular epidemiologists, public health policymakers, and the general public: Is vigorous leisure-time activity protective of primary cardiac arrest? Collection and analysis of case-control data from Seattle and suburban King County, Washington will be used to explore this association.

Primary cardiac arrest, as recently defined by the Joint International Society and Federation of Cardiology/World Health Organization Task Force on Standardization of Clinical Nomenclature is 'sudden event, presumably due to electric instability of the heart, where evidence which allows other diagnosis is lacking. If no resuscitation is applied or if resuscitation is unsuccessful, primary cardiac arrest is referred to as sudden death. Evidence of previous ischemic heart disease may or may not be present. If death occured in the absence of witnesses, the diagnosis is presumptive.'

EVALUATION OF OCCURRENCE OF INFLUENZA & VACCINE EFFICACY

A.S. Monto, University of Michigan, Ann Arbor Campus, School of Public Health, Dept. of Epidemiology, *Ann Arbor, Michigan* 48104

Specimens for virus isolation will be collected in the community of Tecumseh to identify the appearance of influenza virus in this well-defined population. To study past history of seeding or the occurrence of influenza viruses other than the prevalent strain in the community, the collected sera will be tested against antigens of various type A influenza viruses. To determine current and future patterns of infection, approximately 1000 individuals resident in Tecumseh will be recruited for prospective study. The aim here will be to follow a significant number of individuals of all ages to determine the effect of vaccination, the fall off in antibody level induced over time, the seeding of influenza viruses into the community, and the distribution of infection according to antibody status.

ST LOUIS ENCEPHALITIS VIRUS IN TROPICAL ECOSYSTEMS

P. Galindo, Gorgas Memorial Inst. of Tropical & Preventive Medicine Inc., Gorgas Memorial Laboratory, *2007 I St. N.W., Washington, District of Columbia* 20006 (R22 AI 16433-02)

This project has been designed to elucidate the mechanisms by which St. Louis Encephalitis (SLE) virus cycles in tropical ecosystems, and to compare the biological characteristics of SLE strains representing different survival mechanisms of the virus in Panama and in the U.S.A., so as to assess possibilities of periodic introduction of the virus into the U.S.A. from the neotropics with the occurrence of urban epidemics and vice versa. A close monitoring for SLE activity will be maintained at three or more distinct tropical ecosystems where the virus previously was isolated. Dynamics of transmission will be studied by virus isolation from mosquitoes with determination of vectorial capacity of mosquitoes, including transovarial transmission and host preference. Viremia patterns of suspected vertebrates will also be studied. Characterization of SLE strains will be done at Yale University.

PATHOGENICITY OF VISCERAL LARVA MIGRANS IN CHILDREN

S.M. Friedman, New York City Dept. of Health, *65-71 Worth St., New York, New York* 10013 (R01 AI 16419-02)

The Visceral Larva Migrans Project is a comprehensive investigation which will determine for the first time the prevalence and pathogenicity of this condition in children. The host and environmental factors which influence the acquisition of the infection and the expression of clinical disease will also be defined.

Screening of 8,000 sera from the Lead Poisoning Control Program by the Enzyme-linked Immuno-Sorbent Assay for antibodies to the second larval stage of Toxocara canis, the canine roundworm, will produce an estimated 3.5 percent positivity rate. These 280 positive children and 280 matched controls are then given detailed home questionnaires and clinic examinations. The questionnaire elicits demographic data, information on the subject's play habits and play areas, pet ownership and other animal contact, medical history and parental assessment of how the child functions. An objective appraisal of the interior and exterior home environment is also made. At the clinic sessions, a pediatric physical examination, an ophthalmologic examination, a developmental screening and further blood testing are performed blind on every subject. Referrals are made for all children with positive findings.

This comprehensive investigation will not only be the definitive study of Visceral Larva Migrans of children in an urban environment but also reveal valuable insights on pica-related conditions, urban zoonotic conditions, and chronic manifestations of infectious diseases.

INTERNATIONAL RESEARCH IN INFECTIOUS DISEASES

T.C. Orihel, Tulane University of Louisiana, School of Public Health & Tropical Medicine, Dept. of Tropical Medicine, *6823 St. Charles Ave., New Orleans, Louisiana* 70118 (P01 AI 16315-01)

The primary objective of the proposed Tulane ICIDR is to develop research program in Colombia, South America, with headquarters in Cali, which will address major public health problems of the country, the neotropical region and the hemisphere, and which will be of interest and importance to the scientific community in other parts of the world. The research will be carried out as a collaborative effort between Colombian and American scientists on a broad interdisciplinary base and will focus primarily on parasitic diseases of man and, in certain instances, on related immunological problems. The major effort will be directed toward basic biological and epidemiological investigations of selected vector-borne, parasitic diseases of man including filariasis, leishmaniasis, trypanosomiasis and malarin. In connection with some of these activities, integrated studies on the vectors and vector-parasite relationships will be carried out. Parasitic diseases of the upper gastrointestinal tract namely, giardiasis and strongyloidiasis will be investigated with emphasis on the physiological environment in the gut which may favor the colonization by the parasites and produce symptomatic disease. Infectious diseases in pediatric populations of Colombia and the various factors which mediate the immune responses of children to infections represent other areas of special interest to the program. The Colombian Fund for Scientific Research (COLCIENCIAS) is the Colombian host and counterpart organization of the Tulane program. The program is open to Colombian scientists and institutions from throughout the country.

IMMUNOBIOLOGY AND EPIDEMIOLOGY OF LEPROSY

K.E. Nelson, University of Illinois, Medical Center at Chicago, Abraham Lincoln School of Medicine, Dept. of Preventive Medicine & Community Health, *1853 W. Polk St., Box 6998, Chicago, Illinois* 60680 (P01 AI 16308-02)

This US-Thai collaborative program is designed to provide epidemilogic and immunologic information required for improved prevention or treatment of leprosy, and to provide better pharmacologic data for the use of common drugs in tropical areas of the world. The program is built upon the long-standing collaboration between the faculties of The University of Illinois College of Medicine and Chiang Mai University in northern Thailand. The Illinois core facility is the US center and includes laboratories for training Thai workers for work to be done in Thailand. The Chiang Mai core is the Thai laboratory and clinical facility. McKean Rehabilitation Institute, Chiang Mai, will provide access to 300 leprosy inpatients and 2000 outpatients through its associated villages and clinics. The component projects will investigate leprosy from epidemilogic, genetic, and immunologic viewpoints. M. leprae specific and nonspecific antibody, lymphocyte, and phagocytic cell responses will be characterized using techniques from the Universtity of Kentucky, and the University of Illinois. Studies of the role of immune complexes in leprosy and its complications including glomerulonephritis and erythema nodosum leprosum will be based at the University of New Mexico.

All component projects involve Thai co-investigators who, after training in the US, will implement the research in Thailand.

ENDEMIC SCHISTOSOMIASIS AND CHAGAS' DISEASE IN BRAZIL

T.H. Weller, Harvard University, Boston Campus, School of Public Health, Dept. of Tropical Public Health, *55 Shattuck St., Boston, Massachusetts* 02115 (P01 AI 16305-02)

This multidisciplinary program project research effort on Chagas' disease reflects collaborative work between Brazilian scientists and scientists from Harvard. Two core research units, one laboratory-based and one clinical, have been developed at the Federal University of Bahia, Salvador, Brazil, and a third core unit developed with FioCruz encompasses rural populations in Bahia where Chagas' disease is endemic. The Harvard component operates under the sponsorship of the Pan American Health Organization.

A major objective is the elucidation of the natural history of Chagas' disease in an area where the disease is hyperendemic. This is being done by combined clinico-parasitologic-immunologic-entomologic longitudinal studies, particularly in Castro Alves and Riacho de Santana. A second project focuses on cardiac arrhythmias in Chagas' disease as detected by ambulatory electrocardiographic monitoring.

Two projects focus on cellular and humoral immunoregulatory processes in Chagas' disease, one in man and the other in a murine model. The objective is to elucidate the determinants of progression or of non-progression of infection with Trypanosoma cruzi.

ARTHROPOD-BORNE DISEASES AND THEIR CONTROL

R.H. Baker, University of Maryland, Baltimore Professional Schools, School of Medicine, Inst. of International Medicine, *655 W. Baltimore St., Baltimore, Maryland* 21201 (P01 AI 16289-01)

We propose to continue our existing program of research on arthropods of medical importance in Pakistan. With core support in Baltimore and Lahore (Pakistan Medical Research Center) and in collaboration with Pakistani and third country scientists, eight interrelated projects are proposed: 1) Mosquito and disease ecology and genetic control. 2) Genetic studies to control Anopheles culicifacies. 3) Genetic control of Anopheles stephensi. 4) Genetic studies to control arbovirus vectors. 5) Epidemiology and ecology of human arbovirus diseases. 6) Studies on imported filariasis in Pakistan. 7) Clinical and epidemiologic studies on malaria and viral fevers. 8) Systematics, biology and vector potential of ticks.

Particular emphasis is placed on developing new biological methods to control those arthropod species that transmit human pathogens. Genetic manipulation of vector mosquito species has been developed to the stage where field release trials of lab-reared populations, carrying deleterious genes, are currently in progress. Addtionally, field studies of mosquito predators and pathogens as control agents are continuing. A clinical component is being established that will relate these control projects directly to malarial and viral diseases. In a like manner a tick project is propsed, in order to define the role of ticks in the transmission of viral, rickettsial and protozoal agents.

SCHISTOSOME SUSCEPTIBILITY STUDY ON BRAZILIAN SNAILS

G.E. Rodrick, State University System of Florida, University of South Florida, School of Medicine, Dept. of Comprehensive Medicine, *4202 Fowler Ave., Tampa, Florida* 33620 (R21 AI 16287-02)

Governmental mass relocations of unemployed Brazilian families from coastal foci endemic for schistosomiasis to agricultural colonies in the interior of Northeast Brazil are occurring at a rapid rate. Many of these agricultural colonies are in close association with irrigation projects which are made up of many small water ways which serve as ideal habitats for potential vector snails. The potential vector snail in this area is Biophalaria straminea and it has recently been shown to be susceptible to Schistosoma mansoni. Therefore, B. straminea may be an important vector for the spread of schistosomiasis in these areas due to its distribution and its association with high levels of infection.

The objectives of this project are to: (1) investigate under laboratory conditions the susceptibility of various geographical isolates of B. straminea from the newly developed agricultural colonies; (2) examine the infectivity of cercariae produced by B. straminea under laboratory conditions; (3) examine field collected B. straminea in and near newly developed agricultural colonies for naturally-acquired infections of S. mansoni; (4) verify the identity of B. straminea and/or other snails collected in or near the agricultural developmental colonies; and, (5) delineate geographical areas of occurrence of B. straminea and/or other snails which possess the ability to serve as a vector for S. mansoni.

The research deals with snail biology and intermediate host-parasite relationships and is vital to the formulation of control strategies. The economic benefit brought by irrigation practices can be hindered by the great loss due to the disease unless effective control measures are taken.

BASIC AND APPLIED RESEARCH iN PROTOZOAN DISEASES

T.C. Jones, Cornell University, Medical Center, Cornell Medical College, Dept. of Medicine, *1300 York Ave., New York, New York* 10021 (P01 AI 16282-02)

Diseases caused by the Leishmania-Trypanosoma complex are of major importance in the Wester Hemisphere. The diseases exhibit marked variation in clinical manifestations yet, taxonomically, biochemically and immunologically, they maintain many similarities which may provide clues to pathogenesis. Control of these diseases will result from careful evaluation of pathogenic mechanisms, antimicrobial therapy, disease patterns, and methods of accurate diagnosis. This program project brings together basic science and clinical investigators from Cornell University Medical College and The Rockefeller University and respected Brazilian investigators from the University of Bahia and the University of Brasilia. The central focus of this collaborative effort is the integration of basic and applied clinical research. The major research areas include: 1) basic parasitology, immunobiology and pharmacology of Chagas' disease and leishmaniasis; 2) clinical disease patterns, epidemiology and genetics these disease; and 3) application of immunologic techniques for understanding pathogenesis and for reliable diagnosis. Central to this grant is the attempt to coordinate the activities of investigators from different disciplines to allow exchange of limited resources, to bring these investigators in contact with young researchers abroad, and to advance our understanding of important human diseases.

EPIDEMIOLOGY OF CHLAMYDIA TRACHOMATIS INFECTIONS

J.T. Grayston, University of Washington, School of Public Health & Community Medicine, Dept. of Epidemiology, *4000 15th Ave. N.E., Seattle, Washington* 98105 (R01 AI 16222-02)

This project is designed to increase knowledge of the epidemiology of human Chlamydia trachomatis infections. The etiological role of these organisms in trachoma, non gonorrheal urethritis (of the male), inclusion conjunctivitis of the newborn, and pneumonitis of infancy has been established and much has been learned about the epidemiology of C. trachomatis infections of the eye, the genital tract, and newborns in both trachoma endemic and nonendemic areas of the world. Evidence regarding the disease significance of C. trachomatis infections of the female genital tract (cervicitis, salpingitis, peritonitis and perihepatitis) has been accumulating and studies of these infections are proposed. Although no etiological significance has yet been demonstrated, the organisms have been isolated from the middle ear, pharynx and the rectum. We have serologic epidemiological data from U.S. population groups strongly suggesting that these organisms cause more frequent infection than can be accounted for by known eye and genital tract disease. Our serological data suggests that C. trachomatis is etiologically associated with pneumonia of children after infancy and in adults. A series of studies of the role of C. trachomatis in pneumonia and acute lower respiratory disease are proposed. In addition we plan to utilize our unique specific serological test (micro immunofluorescence) for both serum and local secretions in

preliminary studies of various disease syndromes potentially associated with C. trachomatis (acute respiratory disease, chronic obstructive pulmonary diseases, sinusitis, otitis, ideopathic inflammation of the bowel) to identify targets for some specific etiological and epidemiological studies. Patients with compromised pulmonary (e.g. cystic fibrosis) or immunological systems will be studied to determine the potential role of C. trachomatis in their disease process. Also, couples with infertility problems will be similarly investigated.

NEONATAL CHLAMYDIA INFECTION - INCIDENCE AND TREATMENT

E.R. Alexander, University of Arizona, School of Medicine, Dept. of Pediatrics, *1501 N. Campbell Ave., Tucson, Arizona* 85721 (R01 AI 17326-02)

Chlamydia trachomotis, an intracellular parasite, is the etiologic agent of trachoma, non-gonococcal urethritis and inclusion conjunctivits. It can also infect the cervix of women and during pregnancy, the organism may be acquired by the infant during passage through the birth canal at delivery. The infant may subsequently develop inclusion conjunctivitis or pneumonia. We intend to investigate in this proposal, the risks and consequences of perinatal chlamydial infection and to explore various means of intervention and treatment.

These objectives will be accomplished by means of prospective incidence studies, prophylaxis and treatment trials: 1) We shall study the efficacy of prenatal treatment of pregnant women with chlamydial infection, with erythromycin on the eradication of the infection and the prevention of subsequent chlamydial infection in the infant. 2) Evaluate erythromycin ointment as an alternative neonatal ocular prophylaxis for the prevention of neonatal chlamydial infection. 3) Evaluate oral erythromycin versus topical sulfonamide for the treatment of neonatal chlamydial conjunctivitis. 4) Determine the incidence of pneumonia due to C trachomatis in infants under one year of age and evaluate the comparative efficacy of treatment with oral erythromycin or ampicillin. 5) Determine if C. trachomatis plays a role in middle ear disease in children, and finally 6) Investigate the prevalence of chlamydial infection in the families of infected infants.

CHARACTERIZATION AND DETECTION OF VIRUSES AND ANTIBODIES

N.J. Schmidt, State Dept. of Health Services, Laboratory Services Branch, *2151 Berkeley Way, Berkeley, California* 94704 (R01 AI 15990-01A1)

The broad objective of the proposed research are characterization and detection of certain viral antigens and antibodies, and application of the findings to studies on the etiology and pathogenesis of human diseases. The three major areas of activity are: 1. Identification of the various antigenic components of varicella-zoster virus and determining which are shared by related human and simian herpesviruses; studying antibody response to the various components in primary and secondary infections; developing monospecific reagents for improved serodiagnosis of infection. 2. Application of sensitive and specific radioimmunoassay (RIA) and enzyme immunoassay (EIA) methods for detection of group B coxsackievirus antigens in an animal model and in human infections, application of these methods to studies on the pathogenesis of infection and on the ability of group B coxsackieviruses to establish latent or persistent infections in the animal or human host. 3. Development, evaluation and comparison of RIA and EIA methods for direct detection of viral antigens or antibodies in certain body fluids, excretions, secretions and peripheral blood leucocytes, using animal models and then extending the findings to human clinical materials. To use these methods for studies on the pathogenesis and epidemiology of certain viral infections.

PSYCHOSOCIAL AND BIOCHEMICAL RISKS FOR MONONUCLEOSIS

E.G. Shaskan, University of Connecticut, Health Center, School of Medicine, Dept. of Psychiatry, *Farmington Ave., Farmington, Connecticut* 06032 (R01 AI 15901-03)

Psychosocial factors in the development of clinical illness have been extensively documented. It is probable that at least one mode of action of these factors is through modifying host-resistance as an outcome of central nervous system physiology, including hypothalamic neuroendocrine pathways. Since the disposition and metabolism of hypothalamic monoamines, especially dopamine, is reported to be intimately related to several hypothalamic releasing hormones, blood platelet monoamine oxidase (MAO) activity, as a genetically stable marker, is postulated to be a simple screening procedure for hypothalamic dopaminergic physiology. Perhaps psychosocial factors and platelet MAO activity can be ultimately synthesized in a multivariate equation, predicting risk for clinical symptoms of infectious mononucleosis (IM). Such risk for physical illness, when considering preliminary platelet MAO data alone, appears to be antithetically related to risk for certain psychiatric illnesses.

Following two successive years of preliminary, prospective studies of IM in college age students, a fully-prospective epidemiologic design has now been generated to include a variety of psychosocial instruments in addition to prospective evaluations of platelet MAO activity. Preliminary evidence to date identifies clinical IM as dependent upon brain and behavior. The existence of a fluorescent method for Epstein-Barr virus (EBV) antibody screening, utilized prospectively, is the principal serological basis upon which clinical IM and inapparent EBV infections are discriminated. Through such means of prospective discrimination, the psychosocial and biochemical risk factors are evaluated and synthesized within the broad interactive fields of modern medicine and psychiatry.

PNEUMOCOCCAL VACCINE IN THE INSTITUTIONALIZED ELDERLY

D.W. Bentley, University of Rochester, School of Medicine & Dentistry, Dept. of Medicine, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (R01 AI 15778-02)

To evaluate the current pneumococcal vaccine in the institutionalized elderly by observing vaccine-associated reactions and subsequent incidence and etiology of pneumonias in pneumonia-associated mortality.

A total 1,340 patients, already admitted to 3 different long-term care institutions, received the pneumococcal vaccine. Vaccine-associated reactions overall occurred in 177 (13.2%) of the patients. Acute systemic reactions were noted in 2 (.14%), discomfort in 108 (8.1%), erythema in 70 (15.4%), induration in 32 (2.4%) and fever in 28 (2.1%). Vaccine-associated reactions were significantly more frequent in males than females. Males demonstrated a progressively increasing number of infections from less than 50 years of age (13.0%) to a peak of 60-69 years of age (25.5%). Thereafter, the frequency of reactions decreased in those 70 years of age and older. The same trend was noted for women, although the frequency of reaction was lower. Review of the results for the first 5 months of the surveillance program for pneumonias indicated that radiographically confirmed pneumonias occurred frequently (9-21% of the vaccinated and non-vaccinated population, depending on the institution) but S. pneumoniae was isolated much less frequently than expected (17-30%), and was considered the primary agent in only about 1/3 of the cases. Most of the S. pneumoniae isolates were types or groups not represented in the vaccine, especially in vaccinees. Two cases of pneumonia (both Type 9 and from the same institution), however, did occur in vaccinees who had chronic bronchitis as a predisposing illness.

EPIDEMIOLOGY OF THE GROUP B STREPTOCOCCUS

B.F. Anthony, University of California, Los Angeles Campus, Los Angeles County Harbor General Hospital, *1000 W. Carson St., Torrance, California* 90509 (R01 AI 15698-02)

Pregnant women and newborn infants will be followed to detect and measure group B streptococci, an important cause of newborn infections. The purpose is to understand the epidemiology and carriage of this bacterium, particularly with reference to the gastrointestinal tract. Healthy adult volunteers will be studied to locate the sites of streptococcal carriage in the gastrointestinal tract. Patients and their contacts will be studied in a venereal disease clinic to evaluate the importance of sexual transmission in streptococcal spread.

CONTROL OF HOSPITAL-ACQUIRED URINARY TRACT INFECTIONS

J.P. Burke, LDS Hospital, Dept. of Internal Medicine, *325 8th Ave., Salt Lake City, Utah* 84103 (R01 AI 15655-02)

Our overall objective is to develop and evaluate methods for the prevention and control of hospital-acquired urinary tract infections associated with the use of indwelling bladder catheters. We have established continuing daily bacteriologic monitoring of urinary drainage systems by catheter care team and have developed methods for incorporating our bacteriologic and epidemiologic data into patients' computerized hospital records. We propose to evaluate our monitoring system as a technic to assist in patient care, medical audit, and long-term epidemiologic study. We are conducting systematic studies of methods which may help prevent catheter-associated infections. These methods include the use of silicone catheters and daily meatal care with various disinfectants. We have identified meatal colonization with gram-negative bacilli as a major risk factor for later bacteriuria, and we are studying epidemiologic determinants of meatal colonization as well as technics to block retrograde extra-lumenal spread of bacteria into the urinary bladder.

INTERDISCIPLINARY RESEARCH CENTER IN IMMUNOLOGIC DISEASE

J.P. Leddy, University of Rochester, School of Medicine & Dentistry, Dept. of Medicine, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (P50 AI 15372-03)

The interdisciplinary research center in Immunologic diseases has two major goals. The first is educational and the second the undertaking of fundamental immunologic research on clinically relevant problems related to the pathogenesis of allergic diseases.

Through the educational program, the center attempts to improve diagnosis and care of patients with allergic diseases by updating the core of fundamental immunologic knowledge of practicing physicians within the geographic region served by the center. The educational programs include a course of lectures given by the center members in the community hospitals, which covers topics and concepts in basic Immunology followed by lectures which deal with the diagnosis and treatment, and pathogenesis of specific allergic and immunologic diseases.

The research involves three areas. Each concerns understanding pathophysiologic or pathogenetic mechanisms underlying a particular allergic and/or immunologic disease. Further, because certain aspects of these projects require fundamental physiochemical and biochemical techniques and expertise, two of the three projects involve co-operative, collaborative research between scientists in the departments of Medicine, Pediatrics, Biochemistry and Chemistry.

The projects involve (1) a prospective study of the effects of respiratory syncytial viral infection in infancy on the development of chronic respiratory disease or asthma in later life; (2) a comparative study of the alpha and beta adrenergic receptor number and function on leukocytes in normal and asthmatic individuals; and (3) studies which involve determination of the characteristics of the human autoimmune response and separately, of human monoclonal IgG cryoglobulins.

INTERDISCIPLINARY RESEARCH IN IMMUNOLOGIC DISEASES

J.A. Bellanti, Georgetown University, International Center for Interdisciplinary Stud. of Immunol., *37th & O Sts. N.W., Washington, District of Columbia* 20007 (P50 AI 15321-03)

The Center for Interdisciplinary Research in Immunologic Diseases (CIRID) grant supports four projects each of which involves a collaborative effort between basic laboratory scientists and clinicians. The first project involves the development of a temperature-sensitive mutant of Haemophilus influenza and to evaluate its potential for use as a safe and effective vaccine. The second project deals with the characterization of the Langerhans cell and its role in normal immunologic function as well as in dermatologic disease. The third project in the CIRIDs program concerns the role of prostaglandins in asthama. The purpose of this project is to study prostaglandin metabolism by alveolar macrophages and peripheral blood leukocytes and to relate differences in metabolism to sex and to the presence of an asthmatic condition. The fourth project in the program is a community outreach approach to understanding the various factors that interact in allergic disease in the Washington Metropolitan area. This outreach involves two different approaches. The first is an epidemiologic survey to determine the incidence and significance of allergic disease in the Metropolitan area based upon existing local and national health statistics as well as direct contact with health care facilities. The second approach involves an educational intervention program which emphasizes self-management techniques for asthmatics and their parents.

NORTH CAROLINA PROGRAM ON SEXUALLY TRANSMITTED DISEASE

P.F. Sparling, University of North Carolina, Chapel Hill Campus, School of Medicine, Dept. of Medicine, *Manning Dr., Chapel Hill, North Carolina* 27514 (P01 AI 15036-03)

This is a multidisciplinary program project, with research activities in the areas of gonorrhea and syphilis. Emphasis is on both basic microbiology and immunology, and applied problems such as organism identification and clinical epidemiology.

Four integrated projects focus on the gonococcus, including basic genetics, biochemistry and antigenicity of the cell surface; virulence and host immune response; and importance of cell-wall deficient forms in human disease. Two integrated projects examine the basic physiology, pathogenicity, and immunology of T. pallidum.

NOSOCOMIAL INFECTION IN SURGICAL PATIENTS

R.A. Garibaldi, Utah Higher Education System, University of Utah, School of Medicine, Dept. of Internal Medicine, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (R01 AI 14533-03)

We are studying the pathogenesis, epidemiology, and economic impact of postoperative infections. We have designed a quantitative method for sampling low levels of bacterial contaminations of wound surfaces using a micropore filter mounted on a nutritive agar media. We are evaluating the clinical application of this technique in an animal model prior to human use.

Our clinical studies have delineated risk factors which predispose to the development of postoperative pneumonias and have identified possible ways to reduce the likeiihood of their occurrence. We have shown that some practices (i.e., bacterial anesthesia filters) which were introduced to prevent pneumonias are ineffective and add great cost to our health care budget unnecessarily. We have studied patterns of use and abuse of prophylactic antibiotics in surgery in 21 Utah hospitals. We found that prophylaxis was often prescribed too early, too late or too long and that prophylaxis was not indicated on approximately 80% of the days on which it was prescribed. Other clinical studies are attempting to define the infectious consequences of misused prophylactic antibiotics as well as the direct costs associated with specific postoperative infections.

CLINICAL EPIDEMIOLOGY-PATHOGENESIS OF GENITAL HERPES

L. Corey, University of Washington, School of Public Health & Community Medicine, Dept. of Epidemiology, *4000 15th Ave. N.E., Seattle, Washington* 98105 (R01 AI 14495-04)

Genital Herpes Simplex Virus (HSV) infection is a disease of major public health importance. Its frequent recurrence rate, its complications of meningitis, and radiculitis, and its association with neonatal morbidity and cervical cancer make studies of the natural history, immunology and therapy of HSV of broad interest. We propose to study the natural history, immunology and therapy of HSV of broad interest. We propose to study the natural history of genital HSV infection, to determine whether the disease changes in character or rate of recurrence over time. We will systematically obtain clinical epidemiologic information and perform virus isolation on all cases, and will obtain detailed virologic and immunologic data on selected cases to define host factors and type or strain specific viral factors which may influence the clinical manifestations, severity and risk of latency and of recurrence. Because we have determined that genital HSV-1 infections recur less often than genital HSV-2 infections, we will compare cellular, humoral and local immune responses of primary HSV-2 vs. primary HSV-1 infection to determine whether differences in immune response to these types are related to differences in the recurrence rates of genital disease. We will prospectively follow exposed sexual partners to define the risk of transmitting genital HSV and define the role asymptomatic shedding of virus plays in this process. Restriction enzyme analysis of HSV strains will also be employed to assess the contribution of exogenous reinfection to recurrent disease. The effect of pregnancy on the severity and recurrence rate of genital HSV disease and the natural history of pharyngeal and rectal HSV will also be studied. Pilot studies to define the prevalence and incidence of disease in specific populations will be undertaken.

EPIDEMIOLOGY OF INFECTION WITH ATYPICAL MYCOBACTERIA

H. Gruft, State Div. of Lab. & Research, *Empire State Plaza, Albany, New York* 12223 (R22 AI 13613-05)

Persons infected by Mycobacterium intracellulare, as demonstrated by positive skin test to the antigen, are concentrated in the southeastern coastal area of the United States. This geographical distribution is unlike that of persons exposed to M. tuberculosis and provides a hypothesis to the possible source of infection with M. intracellulare and other atypical Mycobacteria. Our research proposed to continue testing the hypothesis that the source of the infection is Mycobacteria residing in either the estuaries or fresh water of the southeastern United States or animals (birds especially) that are associated with these habitats. These Mycobacteria are concentrated at the surface of bubbles formed during wave action and rain or spread in dusts. The experimental approach involves sampling air as well as surface and subsurface waters and soils in various areas of the southeastern United States, at and off the coast of Virginia, South Carolina, Maryland, etc. Initial studies by the principal investigators have already demonstrated the effectiveness of this approach. The concentration of Mycobacteria, their frequency of isolation, and identification of each isolate will be part of this study. The data concentration and frequency of isolation, and identification of each isolate will be part of this study. The data of concentration and frequency of isolation will be compared to samples from areas where the incidence of infection with M. intracellulare is lower (upstate New York and New England). In addition, the physiological ecology of these organisms is being investigated to determine the basis for the unique geographical distribution.

OCCUPATIONAL HYPERSENSITIVITY CHEST DISEASES

J.E. Salvaggio, Tulane University of Louisiana, School of Medicine, Dept. of Medicine, *1430 Tulane Ave., New Orleans, Louisiana* 70112 (P50 AI 13401-06)

Investigative pursuits will focus on environmental and occupational factors which may contribute to selected forms of hypersensitivity pulmonary disease. The overall projects are divided into three major sections. Section 1 focuses on mold sensitive environmental asthma (New Orleans Asthma) and is concerned with the development of biologic assays for detection of antibodies to fungal antigens and determination of the immune response of man to these antigens. Section 2 is concerned with studies of cottonseed and cotton dust induced airways disease. It

includes studies on the effect of cotton dust and seed products on lymphoid cells and cyclic AMP concentrations of cottonseed workers and attempts to identify active components in cottonseed products. Clinical activity of the antigens will also be established by provocation inhalation challenge testing. Section 3 is concerned with the effect of environmental tobacco smoke on atopic and non-atopic subjects and includes studies to analyze the possible immunogenicity and allergenicity of smoke products in man and the relationship between any putative smoke allergens and 'tobacco smoke' asthma. Isolation and analysis of immunogenic components of tobacco smoke, characterization of their physical and chemical properties and assays for detection of specific IgE antibody in the population-at-large against these products will also be studied.

GENETICS OF IMMUNE RESPONSE IN MAN

D.G. Marsh, Johns Hopkins University, School of Medicine, Dept. of Medicine, *725 N. Wolfe St., Baltimore, Maryland* 21205 (P01 AI 13370-04)

The overall aim of the project is to elucidate the genetic factors which determine (or influence) human immune responsiveness. This study is unique in that we are studying human immune response toward several ultra-pure pollen allergens in an epidemiologically defined population, as well as allergy patients and the consanguineous Amish population. We are studying both unrelated subjects and families.

An important aspect of the work is a longitudinal study of the variation in phenotypic expression of responsiveness within an individual. Only with this knowledge is it possible to investigate definitively the role of genetic factors, including hypothesized immune response (Ir) and immune suppression (Is) genes, in determining human immune responsiveness and allergy. Segregation and linkage analysis will be performed to test for the presence of major genes, especially in relation to total IgE and specific IgE and IgG antibody production. An important aspect of our work is the studies of the mechanisms of immune supression using in vitro culture techniques, and taking advantage of the availability of unique HLA haplotypes from the Amish population. This project is the first such rigorously designed investigation of the genetics of immune response in man, which serves as a model for studying human immune responsiveness toward complex antigens under conditions of naturally limiting low dosage exposure.

EPIDEMIOLOGY OF HEPATITIS B ANTIGEN AND VIRAL HEPATITIS

V.M. Villarejos, Louisiana State University, Medical Center, School of Medicine, Dept. of Tropical Medicine, *1542 Tulane Ave., New Orleans, Louisiana* 70112 (R01 AI 12910-04)

It is proposed to continue and expand studies on the epidemiology of viral hepatitis being currently conducted in San Ramon-Palmares, two rural counties in Costa Rica where type A, type B and non-A/non-B hepatitis occur endemically in the absence of percutaneous mechanisms of transmission.

The pattern of occurrence and the mode of spread of type B hepatitis will be studied, with emphasis on the definition of mechanisms of transmission and the role that chronic carriers play in the dissemination of the disease. The natural history of hepatitis B antigens will be studied in relation to the pathogeneis of chronic liver disease. The infective potential of the acute case and the chronic HBsAg carrier will be evaluated serologically and epidemiologically.

Serologic and coprologic studies of the antigen and antibody of type A hepatitis will be done to define immunity patterns, shedding of the virus in the familial environment, spread of the infection in the community and factors leading to the occurrence of epidemics in this endemic area.

Clinical, epidemiological and etio-pathogenic studies on the non-parenteral form of non-A/non-B hepatitis prevailing in the area will be performed.

In addition, clinical studies will be continued on antibodies to single-stranded DNA as a diagnostic aid for the early detection of acute hepatitis and the assessment of the course of chronic hepatitis.

VENEREAL DISEASE RESEARCH PROGRAM PROJECT

K.K. Holmes, University of Washington, School of Medicine, Dept. of Medicine, *A-300 Health Sciences Ctr., SC-64, Seattle, Washington* 98195 (P01 AI 12192-05)

This program project has research components: I. Clinical Epidemiology and Pathogenesis of Gonococcal Infections: Methods include auxo-typing, outer membrane protein typing, and fluorescent antibody typing, phagocytosis of gonococci by human polymorphonuclear leukocytes, and use of antigen-specific opsonizing antibody and bactericidal antibody. II. Genetic Studies of Neisseria gonorrhoeae: The general purpose of the proposed research is to study the genetic organization of the gonococcus, Neisseria gonorrhoeae, as well as other microorganisms that cause significant sexually transmitted diseases. The thrust of our research is aimed at recognizing the nature of the determinants that contribute to bacterial virulence. By using classical genetic methods coupled with the newer techniques of recombinant DNA research we have been characterizing the pili genes of the gonococcus. We hope to better understand the precise role by which pili permit gonococci to attach to epithelial cells of susceptible tissues. In another vein, we have shown that a plasmid species is common to all strains of chlamydia. It is possible that this plasmid encodes for a polypeptide important in the pathogenesis of chlamydial disease. III. Nonogonoccal Urethritis and Related Infections: The etiology of chlamydia-negative nongonococcal urethritis, and the clinical spectrum and immunology of chlamydia trachomatis infectons are being studied. IV. Treatment and Pathogenesis of Hemophilus vaginalis Infection: The role of H. vaginalis and anaerobic bacteria in the etiology and pathogenesis of nonspecific vaginitis, and the optimal methods for therapy of this infection are being studied.

HUMORAL, CELLULAR & GENETIC MECHANISMS IN AUTOIMMUNITY

H.O. McDevitt, Stanford University, School of Medicine, Dept. of Medicine, *300 Pasteur Dr., Stanford, California* 94305 (P01 AI 11313-08)

The objective of the research proposal is to study mechanisms of immunogenetics, autoimmunity and immunosuppression in order to translate experimental findings and concepts of basic and clinical immunology into knowledge which is useful for the diagnosis and treatment of human disease. New cell surface antigens coded for by the major histocompatibility complex (MHC) in man will be defined, and their association with specific rheumatic and autoimmune diseases will be studied. The immune response of HLA-B27 positive and negative individuals to purified antigens from strains of Shigella which do and do not cause Reiter's syndrome will be studied. Patterns of autoantibodies and clinical presentation will be investigated in the rheumatic diseases in order to further classify subtypes of disease. Finally, a new modality of immunosuppression, fractionated total lymphoid irradiation, will be studied for efficacy in the treatment of rheumatoid arthritis, autoimmune diseases of laboratory rodents, and rejection of allogeneic bone marrow transplants in dogs.

ECOLOGY AND CONTROL OF ARBOVIRUSES

W.C. Reeves, University of California, Berkeley Campus, School of Public Health, Dept. of Biomedical & Environmental Health Sciences, *Berkeley, California* 94720 (R22 AI 03028-22)

The overall objective of this project will continue to be to gain knowledge of the ecology of arboviruses sufficient to allow effective disease control programs. This will be accomplished by pursuit of seven immediate objectives. To determine the biological and physical traits of mosquito vectors that control their competence as vectors of arboviruses. To evaluate variations in the vector competence of geographically representative collections of field populations of primary vectors of arboviruses. To elucidate alternative methods by which arboviruses overwinter in a temperate area. To evaluate the feasibility of inserting genetically modified mosquito populations into the field to control the numbers and vector competence of natural populations. To extend the knowledge of the biology of disease vectors. To develop statistical models that express the variables that control vector populations and associated viral transmission cycles. To characterize new arboviruses and determine their relationship to human and equine disease.

SUPPORT FOR WORLD REFERENCE CENTER FOR ARBOVIRUSES

J. Casals Ariet, Yale University, School of Medicine, Dept. of Epidemiology & Public Health, *333 Cedar St., New Haven, Connecticut* 06510 (R01 AI 10984-09)

The goal of this Center is to develop and improve techniques for identification of arboviruses and similar viruses through the world; to assist in the diagnosis of disease outbreaks; and to uncover prevalence of infection by these agents through seroepidemiological surveys. The proposed work for the term of this grant is: 1) Identification of from 50 to 70 viral strains, in addition to precise biochemical characterization of orbiviruses in the Changuinola and Palyam serogroups; 2) investigation of serological relationships between Rift Valley fever and the phlebotomus fever serogroup; 3) more precise analyses of the antigenic relationships in the Nairovirus supergroup, particularly by the reduction of fluorescent foci of infection test; 4) seroepidemiological survey for arbovirus activity in Sudan with special stress on the phlebotomus fever antigenic group; 5) an extensive seroepidemiological survey for the presence of antibodies against Lassa, Marburg, Ebola and Congo-Crimean hemorrhagic fever viruses in Senegal, Ghana, Liberia, Nigeria and Sudan will be initiated; this project will be funded in great part by other sources; 6) continued efforts will be made to improve early diagnosis of arbovirus disease, mainly through the use of IF and ELISA tests; 7) distribution of reagents to qualified laboratories.

HEPATITIS, HAA AND ANTI-HAA IN MOTHERS AND INFANTS

M.J. Tong, University of Southern California, School of Medicine, Dept. of Medicine, *2025 Zonal Ave., Los Angeles, California* 90033 (R01 AI 10894-08)

The objectives of this study are the following: 1) To determine the efficacy of hepatitis B immune globulin

(HBIG) in altering the incidence of hepatitis B infection in infants born to (1) chronic HBsAg carrier mothers and to (2) mothers with acute hepatitis B during the third trimester of pregnancy and immediate two month post-partum period. 2) To investigate the value of viral markers of the type B hepatitis virus in determining the frequency of maternal-infant transmission in HBsAg positive carrier mothers and the effect of HBIG on the appearance of these viral markers in the infants. 3) To study the natural course of hepatitis B infection in children found to be HBsAg positive during the course of this research project. 4) To determine the incidence of HBsAg infection in family members of HBsAg carrier mothers and HBsAg positive infants. 5) To study acute A and acute non-A non-B hepatitis infection in pregnant females and its possible transmission of infection to their newborn infants.

EPIDEMIOLOGY OF ECHINOCOCCOSIS

F.L. Andersen, Brigham Young University, School of Biological & Agricultural Sciences, Dept. of Zoology, *B-166 A S B, Provo, Utah* 84601 (R01 AI 10588-10)

Hydatid disease is known to be endemic in several western states, and Utah has had more autochthonous cases than any other state in the contiguous United States. Even though the prevalence of the casuative parasite in natural hosts (mainly sheep and dogs) and in accidental hosts (humans) has decreased markedly since our program began, the problem remains one of significant public health importance and new surgical cases are reported each year. Since the disease is preventable, it is important to strive for an eventual program which would hopefully eliminate the parasite from this region.

A continued research effort is proposed to (1) identify any new endemic foci through continued monitoring of the parasite at field clinics for dogs, at abattoirs for sheep, and at public health clinics for asymptomatic cases in humans; (2) determine prevailing attitudes of residents living in endemic regions through house-to-house surveys in order to identify epidemiological determinants of the disease; (3) attempt to implement a preventive and control program through assistance of personnel from the Utah State Department of Health; (4) develop, distribute, and evaluate educational aids on hydatid disease for subcultures where customary animal husbandry practices suggest a potential for hydatid disease; (5) test additional echinococcocidal drugs against both larval and adult stages of the parasite and study the mechanisms of action of some of the compounds with various analytical electron microscopy techniqes; and (6) determine differences in susceptibility of definitive hosts to protoscolices recovered from different laboratory rodents.

TRANSMISSION AND CONTROL OF CALIFORNIA-GROUP VIRUSES

G.R. DeFoliart, University of Wisconsin, Madison Campus, School of Agriculture & Life Sciences, Dept. of Entomology, *Agriculture Hall, Madison, Wisconsin* 53706 (R01 AI 07453-15)

Research will be continued on a number of parameters that affect the transmission dynamics of La-Crosse (LAC) virus, both factors affecting vertical transmission of the virus through the egg of the vector mosquito, Aedes triseriatus, and factors affecting horizontal amplification through either vertebrated or venereal transmission by transovarially infected male mosquitos.

Relative to vertical transmission, the effect of transovarial virus infection on the net replacement rate of vector females is being determined by quantifying vector female longevity and fecundity and juvenile stage mortality. Relative to venereal transmission, several aspects of male biology and field sampling techniques are being studied. Relative to vertebrate amplification, several aspects of vector female behavior are under study with current focus identification of bloodmeal sources of more than 300 wild females that obtained their bloodmeals under natural conditions. Identification is by enzyme-linked immunosorbant assay.

STUDY OF RESPIRATORY VIRUSES AND MYCOPLASMAS IN VOLUNTEERS

B.R. Murphy, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Inst. of Allergy & Infectious Diseases, Respiratory Viruses Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 AI 00028-22 LID)

Three A/Alaska/77 ca recombinants of A/Ann Arbor/6/60 ca donor virus evaluated in man for level of attenuation. Each of the three were similarly and satifactorily attenuated despite having different genotypes. These observations suggest that M and NS genes of the ca donor virus are not major attenuating genes. A ts-1A2 'revertant' containing suppressor and other mutations leading to loss of ts phenotype was virulent in adult volunteers. This finding identified the ts genes of the ts-1A2 recombinants as genes responsible for attenuation. Recombinants possessing the two ts-1A2 ts genes may not be sufficiently stable genetically and loss of the ts property could have potential epidemiological significance.

LABORATORY AND EPIDEMIOLOGIC STUDIES OF VIRAL HEPATITIS AGENTS

R.H. Purcell, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Inst. of Allergy & Infectious Diseases, Hepatitis Viruses Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 AI 00026-13 LID)

This project consists of continuing studies of the chemistry, structure, epidemiology, immunology and pathology of human and related hepatitis viruses. The goal of such studies is the control of human viral hepatitis by application of the most appropriate methods, including active and passive immunization, chemotherapy and interdiction of spread of the virus.

PROGRESS: Hepatitis A virus has been isolated directly from the stool of a patient into primary African green monkey kidney cell culture, a substrate suitable for vaccine development. The RNA genome of hepatitis A virus is being cloned in E.coli. Modifications in hepatitis B subunit vaccine have resulted in a highly immunogenic and safe preparation that produces a seroconversion in approximately 60% of vaccinees within two weeks of vaccination and in 95% following completion of the vaccination schedule. Non-A, non-B hepatitis agents have been identified. Evidence has been obtained for the existence of an epidemic form of non-A, non-B hepatitis in India. Attempts to transmit the virus to chimpanzees are currently in progress.

BASIC STUDIES ON MYCOPLASMAS

J.G. Tully, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Inst. of Allergy & Infectious Diseases, Mycoplasma Section, *9000 Rockville Pike, Bethesda, Maryland* 20205 (Z01 AI 00027-11 LID)

These efforts cover both basic and applied aspects of mycoplasmas and related wall-free prokaryotes, including their neurotoxins, enzymes and other biological factors involved in virulence, their immunological interrelationships, and their possible role in human disease or in diseases of uncertain etiology. Current projects of interest concern the characterization of a new group of pathogenic spiroplasmas and sero-epidemiological studies on the human exposure to these new microbial forms. Development of an effective culture medium for the recovery and propagation of these organisms from host tissues has also provided a more effective medium for recovery of Mycoplasma pneumoniae from human tissues and washings, and for propagation of other fastidious mycoplasmas.

SYSTEMATICS AND VECTOR RELATIONSHIPS OF CERTAIN PARASITIC ARTHROPODS

C.M. Clifford, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Inst. of Allergy & Infectious Diseases, Rocky Mountain Laboratory, *Hamilton, Montana* 59840 (Z01 AI 00069-49 EB)

The activities of this project currently comprise four main functions: 1) Identification of ticks received from various individuals and government agencies throughout the world. Only one other institution in the world is capable of performing this service. 2) Systematic study of certain groups of parasitic arthropods. The foremost tool in systematic studies, the scanning electron microscope, has greatly aided in elucidating taxonomic concepts in acarines actually or potentially involved in transmission of disease agents. 3) Retrieval and use of tick data in the Smithsonian data retrieval system. Installation of a mini-computer-word processor system at RML to communicate with NIAID and Smithsonian computers. 4) Colonization of medically important arthropod vectors, which are furnished to outside investigators.

NATURAL HISTORY OF TICK-BORNE RICKETTSIAL AGENTS AND THEIR PUBLIC HEALTH SIGNIFICANCE

W. Burgdorfer, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Inst. of Allergy & Infectious Diseases, Arthropod Borne Diseases Section, *Hamilton, Montana* 59840 (Z01 AI 00061-18 EB)

This project is concerned with studies of Rocky Mountain spotted fever and other tick-borne rickettsial diseases in the United States and other countries regarding ecology, identification, and characterization of the rickettsial agent(s) with their associated vectors. With collaboration of outside agencies (state health departments, public health laboratories, hospitals, physicians, etc.) source material for comparative studies on the various rickettsial types and information about the distribution of vector species associated with spotted fever in the United States is obtained. This project also considers the cellular and subcellular aspects of interaction between tick-borne agents, particularly rickettsiae, and their vectors.

AEDINE EGGS, TOXORHYNCHITES AND ARBOVIRUSES

L. Rosen, University of Hawaii System, Manoa Campus, Pacific Biomedical Research Center, Pacific Research Unit, *2538 The Mall, Honolulu, Hawaii* 96822 (R22 AI 17953-01)

The program will focus on two partially overlapping themes in the hope of contributing to the eventual control of arthropod-borne viral infections. The themes will be, 1) dengue viruses; their epidemiology, their interaction with mosquitoes, and the diagnosis, pathogenesis, and prevention of disease they produce, and 2) the interaction between mosquito-borne viruses in general and all stages of the life cycle of their vectors, with emphasis on aedine species. Five scientific projects are proposd. The first is a study of the genetics of the competence of Aedes aegypti as a vector for the dengue viruses, with the long-range objective of developing virus-resistant strains of Ae. aegypti for liberation in the field. A second is a study of the factors which affect the transovarial transmission of dengue viruses by mosquitoes, with the objective of obtaining information which can be utilized to evaluate the importance of such transmission for survival of dengue viruses in nature under adverse environmental conditions. The third is a study of the suitability of various species of Toxorhynchites mosquitoes as hosts for the isolation and propagation of arboviruses, with the objective of developing one or more species as useful laboratory animals. The fourth has as its principal objective the search for field evidence of transovarial transmission of Japanese encephalitis virus in Asia. The fifth is a study of the relationship between factors which affect hatching of aedine mosquito eggs and the survival and replication of transovarially transmitted arboviruses.

TRANSOVARIAL TRANSMISSION OF ENCEPHALITIS VIRUSES

L. Rosen, University of Hawaii System, Manoa Campus, Pacific Biomedical Research Center, *2538 The Mall, Honolulu, Hawaii* 96822 (R01 AI 17952-01)

The objective of the proposed research is to determine if transovarial transmission of Japanese encephalitis, St. Louis encephalitis, and related viruses by mosquitoes play a role in the survival of these viruses in nature during winter or other periods adverse for their mosquito hosts. It is hypothesized that the viruses survive such periods in eggs of Aedes mosquitoes, and that infection of Culex species (important in transmission of the viruses to man) takes place by feeding on vertebrates infected by Aedes. Field collections of large numbers of immature stages of aedine mosquitoes will be made in Korea, Taiwan, and Hong Kong in areas endemic for Japanese encephalitis virus. Insofar as possible, collections will be made in sites with abundant wild avian populations relatively unaltered by human activity. Pools of the immature mosquitoes will be assayed for the presence of Japanese encephalitis virus by the inoculation of Toxorhynchites amboinensis mosquitoes. The latter will be examined two weeks later by the fluorescent antibody technique. Attempts also will be made to isolate St. Louis encephalitis virus from progeny of various species of Aedes mosquitoes infected in the laboratory by collaborators in California.

3.0941,

THE ETIOLOGY OF ENTERITIS & PROCTITIS IN HOMOSEXUAL MEN

W.E. Stamm, University of Washington, School of Medicine, Dept. of Medicine, *A-300 Health Sciences Ctr., SC-64, Seattle, Washington* 98195 (R01 AI 17805-01)

Within the past five years, the importance of sexual transmission of enteric pathogens has been increasingly recognized in the sexually active male homosexual population. As a result, infectious proctitis-enteritis has become more common in homosexual men. However, fewer than 40% of the cases result from gonococcal infection and the etiology of the remaining cases and the question of mixed infection is still undefined. In this proposed study we plan the following: 1) Use specialized microbiologic techniques in a case control prospective study to ascertain the association of selected pathogens with the enteritis-proctitis syndrome in homosexual men. 2) Describe the histopathology and clinical features of proctitis and/or enteritis due to each pathogen. 3) Characterize the effectiveness of specific therapy in cases in which pathogens are identified and of tetracycline in cases in which no pathogen is identified. 4) Evaluate the epidemiology of proctitis and enteritis in homosexual men, and assess the modes and risk of transmission.

IMMUNOLOGIC ASPECTS OF LEGIONELLOSIS

J.F. Plouffe, Ohio State University, Columbus Campus, School of Medicine, Dept. of Medicine, *370 W. 9th Ave., Columbus, Ohio* 43212 (R01 AI 17552-01)

Legionnaires' disease is endemic in Columbus with more than 70 cases identified since the summer of 1977. We have studied humoral immunity in these patients with the indirect fluorescent antibody and found that antibody does not persist at high titers for a long period. We also have demonstrated that lymphocytes from Legionnaires' disease cases demonstrate sensitization to antigens of Legionella pneumophila in the lymphocyte transformation assay. This reactivity appears to persist for a longer period than the antibody titers. We have also demonstrated that many subjects without a history of Legionnaires' disease manifest low titer antibody levels and reactivity in lymphocyte tissue cultures to L. pneumophila although at a lower level than patients who had documented Legionnaires' disease. Prevalence of immunity to L. pneumophila is unknown. Attack rates in epidemics have been reported to be 1-5%. We propose to expand our initial studies to determine the natural history of sensitization to L. pneumophila. We hope to be able to define an age range when subjects become sensitized to L. pneumophila. We also will look at the microepidemiology of subjects exposed to the hospital environment and the home environment of patients who develop Legionnaires' disease. To facilitate diagnosis we will determine the sensitivity and specificity of the enzyme-linked immunoassay to detect antigens of L. pneumophila in body fluids of patients with Legionnaires' disease.

SEROEPIDEMIOLOGICAL STUDY OF LEGIONELLA INFECTIONS

H.M. Foy, University of Washington, School of Public Health & Community Medicine, Dept. of Epidemiology, *4000 15th Ave. N.E., Seattle, Washington* 98105 (R01 AI 17100-01)

This project seeks to describe the epidemiology of infections due to Legionella pneumophila by a retrospective serologic analysis of paired sera from 4,000 pneumonia patients and compare the frequency of infection and antibody levels with that of basically healthy control groups. The objectives include determination of the community incidence of all four serotypes of Legionella pneumophila pneumonia, by age,

sex, calendar year and season, searching for possible clustering in time and place, describing symptomatology of the pneumonia and also searching for evidence of non-pneumonic infections in the community.

We will adopt the microimmunofluorescence test using formalinized organisms of all four serotypes in the serologic survey. Preliminary studies indicated that non-heated antigens caused fewer non-specific reactions than those heated. The test apears potentially more type-specific, simple, and efficient. Microagglutination or ELISA test will also be utilized. The study of pneumonia was carried out among some 150,000 members of a prepaid medical care group between 1963 and 1975 and the patients have already been thoroughly investigated for evidence of Mycoplasma pneumoniae. Chlamydia trachomatis, influenza A and B, parainfluenza, respiratory syncytial and adenovirus infections. Thus, there is an excellent opportunity to study the relationship of L. pneumophila infection to that of M. pneumoniae or Chlamydia, as well as other viral infections.

CF PATIENTS' DEFENSE MECHANISMS VS. PSEUDOMONAS

N.L. Schiller, University of California, Riverside Campus, School of Natural & Agricultural Sciences, Division of Biomedical Sciences, *Riverside, California* 92502 (R01 AI 17072-01)

The major cause of morbidity and mortality in Cystic Fibrosis (CF) patients is the progressive pulmonary infection caused by Pseudomonas aeruginosa. Although there is no accepted explanation for the susceptibility of CF patients to infection by this particular microorganism, a specific local defect in the immune system is suspected since systematic spread of infection does not occur. Considering the importance of alveolar macrophages for maintaining the sterility of the lower lung, the observation that CF sera couldn't promote the phagocytosis of P. aeruginosa by rabbit alveolar macrophages was particularly relevant. Unfortunately, little information is known concerning human macrophages. With this in mind, this application addresses three specific areas of investigation. First, the identification of human serum components responsible for preventing systemic spread of pseudomonas infections. Second, an examination of the opsonic activity of CF sera for phagocytosis of P. aeruginosa by human phagocytic cells, including polymorphonuclear leukocytes, peripheral monocytes and tissue macrophages. Third, the determination of the ability of Pseudomonas to activate complement. These studies will hopefully provide more information concerning the possibility of defect in the CF patient's humoral or cellular defense mechanisms which might predispose these patients to infection by Pseudomonas.

BIOTYPING & EPIDEMIOLOGICAL STUDIES OF CANDIDA ALBICANS

R.E. Syverson, University of Rochester, School of Medicine & Dentistry, Dept. of Microbiology, *601 Elmwood Ave., P.O. Box 607, Rochester, New York* 14642 (R01 AI 16896-01)

The objectives of this proposal are to develop and evaluate a biotyping system for Candida albicans, to correlate virulence with biotype and to investigate the biotypes associated with colonization and infection of humans. Preliminary data show that natural variation in the assimilation of carbon and nitrogen compounds, surface antigens, and susceptibility to drugs can be utilized to develop a biotyping system. The following three tests may be used to form the basis of a typing system: assimilation of melezitose, susceptibility to 5-fluorocytosine, and serogrouping. Three to five additional tests suitable for inclusion in a typing system will be sought through biochemical and susceptibility studies of strains of C. albicans. Each test will be evaluated for reproducibility and stability of results both through analysis of laboratory strains and analysis of multiple isolates from individual patients. The physiological basis for divergent results and the mutation rate will also be studied. Pathogenicity of the biotypes will be assessed through virulence studies in mice, through analysis of proteolytic enzymes, and by correlation of biotypes with human disease. The epidemiological significance of the system will be evaluated by determining the reliability of the biotyping system, the biotypes colonizing healthy individuals, the biotypes associated with disease, and the ability of the biotyping system to assist in determining whether two strains come from the same or different sources. The clinical significance of the biotyping system will be assessed by correlation of the epidemiological and pathogenicity data. Development and evaluation of this typing system as proposed will lead to a better understanding of the pathogenicity of this microbe and better management of patients at risk of developing an infection with C. albicans.

EPIDEMIOLOGY & CONTROL OF HOSPITAL ACQUIRED INFECTIONS

G.A. Faich, State Dept. of Health, Dept. of Health, *75 Davis St., Room 302, Providence, Rhode Island* 02908 (R01 AI 16642-02)

The objectives of this application are to: 1. Reduce rates of nosocomial infections; 2. Define the magnitude of the problem of nosocomia infections in a representative sample of acute care hospitals using a standardized, prospective data collection system in each institution (descriptive epidemiology); 3. Identify both modifiable and non-modifiable risk factors for nosocomial infection (analytical epidemiology); 4. execute a controlled intervention trial based upon modifiable risk factors identified in the study to determine to what extent nosocomial infections are preventable in the context of 'usual' hospital infection control programs (experimental epidemiology); 5. measure the effectiveness (practicality, compliance) of specific interventions in reducing nosocomial infection rates.

METHODS: A standardized, prospective surveillance system has been established in 12 non-governmental acute care hospitals in Rhode Island. The baseline surveillance is carried out by inplace hospital infection control personnel on carefully selected random samples of patients in each hospital. At the conclusion of the baseline surveillance period, hospital specific interventions will be developed. During the period of intervention, rates of infection and compliance with the intervention will be monitored using the same surveillance system. Comparisons between hospitals, appropriately corrected for differences in types of patients and LOS distribution will be made to control for similar trends and to describe the overall effect of the interventions on the statewide rate of nosocomial infections.

CAUSES OF DIABETES AND OBESITY IN OKLAHOMA INDIANS

K.M. West, University of Oklahoma, Health Sciences Center, College of Health, Dept. of Biostatistics & Epidemiology, *Box 26901, Oklahoma City, Oklahoma* 73190 (R01 AM 21462-03)

In the etiology of diabetes the strength and character of the genetic influences have been poorly defined. Among the main reasons for this are the inadequacies of the data collected, particularly those concerning the present and previous fatness of both probands and family members. In a whole population of Indian adults in which diabetes and obesity are rife, a study is proposed in which data collection would be uniquely complete, including information on glucose tolerance and both present and previous adiposity on all available adults (about 3,200). This will include about 700 with fasting hyperglycemia and several hundred more with varying degrees of impairment of glucose tolerance. Propitious circumstances include the large families, the geographic proximity of family members, and a centralized record system that provides information (on weight and other data) extending over the past 40 years. This will allow a determination of the inter-relationships of obesity and heredity, including an assessment of the extent to which the familial aggregation of maturity-onset diabetes is secondary to the familial aggregation of obesity. Another aspect of the study will be comparison of familial patterns of insulin-independent diabetes of obese and insulin-dependent diabetes of the lean. In diabetes the extent to which there is familial concordance of susceptibility to retinopathy will be examined. Other observations will be designed to confirm that juvenile-onset diabetes is rare in Oklahoma Indians, and to explore possible causes of the paucity.

EPIDEMIOLOGICAL STUDY OF ANALGESIC USE AND RENAL DISEASE

T.G. Murray, University of Pennsylvania, School of Medicine, Dept. of Medicine, *36th & Hamilton Walk, Philadelphia, Pennsylvania* 19174 (R01 AM 20920-03)

This grant proposal is a request for a third year renewal of a study designed to investigate the relative risk of developing end-stage renal disease secondary to interstitial nephritis after the use of analgesics. This is a case control study involving a comparison of the proportion of 550 randomly selected dialysis patients (the case) and 1100 controls who were regular users of analgesics in the past.

The data collected for this study will be completed by the end of the second year, but the analysis of the data will not be completed. During the third year of the study, the data analysis will be carried out and the final reports will be written. In addition, three additional related questions will be investigated. Two of these questions can be answered by using the established data base. The first will determine the prevalence of various potential causes of renal failure in patients with end-stage renal disease currently treated in this country. The second will analyze the psychosocial variables which distinguish regular analgesic users from non-users. Finally, the relationship between the use of analgesics and the development of urinary tract carcinomas will be investigated utilizing one of the research tools developed as part of the analgesic nephropathy study -i.e. the interview. A pilot study of the case-control type will be carried out to determine the feasibility of carrying out a more detailed study.

EPIDEMIOLOGY OF DIABETES AMONG NEW IMMIGRANT YEMENITES

A.M. Cohen, Hebrew University of Jerusalem, Hadassah University Hospital, Diabetic Unit, *P.O. Box 499, Jerusalem, Israel* (R01 AM 20733-03)

We propose to extend our recent preliminary observations in 'new immigrant Yemenites' who had a low prevalence of diabetes (0.03%) in the years 1958-60 showing that in part of the families diabetes has become highly prevalent (9%) above the age of 30, while in other families no diabetes was detected. In families with diabetes, the diabetics consume significantly more mono and disaccharides than non-affected relatives of the same age and sex. Indicating the necessity for interaction between genetic and dietary factors for diabetes to be manifested, a result similar to our experimental observation where, by genetic selection, two strains of rats were inbred, one which after being fed a high fructose (1), glucose (2) or sucrose (3) diet develops diabetes, having common features with the human disease including vascular complications while the other strain fed the same diet remains normal. 700 more 'new immigrant Yemenites' and 300 non-Yemenites as controls will be re-examined. Diabetes will be detected by an oral glucose tolerance (g.t.) the genetic familial tree and dietary intake - carbohydrate, mono and disaccharides, fat, protein and fiber - of each individual will be studied.

We will also try to identify marker(s) of diabetes in the affected and non-affected families by the following tests: a) early phase of insulin release following i.v. g.t.; b) glucagon response; c) insulin receptors in blood granulocytes; d) blood lipids - beta lipoproteins, cholesterol, triglycerides and LDL; e) HLA antibodies and f) antipancreatic islet cells.

The proposed study in a group with almost no diabetes 20 years ago that has changed to a Western environment and in which there are today families with a high prevalence of diabetes and families without diabetes is a unique group to study the interaction of the genetic factor(s) and the different factors related to the manifestation of diabetes such as sex, obesity, age, physical activity, dietary intake, and the

different tests which may be used as indicators for the genetic susceptibility to diabetes.

GENETICS OF RHEUMATIC DISEASE IN ISOLATED POPULATIONS

W.B. Bias, Johns Hopkins University, School of Medicine, Dept. of Medicine, *725 N. Wolfe St., Baltimore, Maryland* 21205 (R01 AM 20656-02)

In the continuation of this project we propose to: carry out additional family studies in the Amish population where we have found high frequency of sacroiliitis and spondylitic disease which is less strongly associated with HLA-B27. Further delineete the HLA-D related products in the Chippewa Indians where rheumatoid arthritis occurs in minimum of 5 percent of the tribe. Continue in vitro studies of the relationships between infectious agents and the B27-associated diseases, now using more serologically specific organisms and lymphocytes from subjects known to have exposure to these agents. Continue to explore several genetically-related phenomena (T cell function, complement component deficiency and autoantibodies) and their relation to HLA-D in families with systemic lupus erythematosus, Sjorgrens syndrome and polymyositis.

SPECIALIZED CENTER OF RESEARCH IN UROLITHIASIS

L.H. Smith, Mayo Foundation, *200 1st St. S.W., Rochester, Minnesota* 55901 (P50 AM 20605-04)

The central research theme of the Mayo Clinic Specialized Center of Research (SCOR) in Urolithiasis is to examine the factors that promote and prevent crystal growth within the urinary tract in order to further understand the mechanisms that allow stone formation and to improve treatment to prevent this complication. The specific objectives of the Mayo Clinic SCOR in Urolithiasis are: 1) to examine sites of reabsorption and secretion of the major ion species within the nephron; 2) to better define the relative roles of supersaturation, inhibitor activity, matrix and epitaxy in animal models and patients with calcium urolithiasis; 3) to measure the effect of therapy on the multiple factors involved in crystal growth in the urine of patients actively forming stones in the urinary tract; 4) to identify abnormalities caused by stone producing stresses that result in urolithiasis in some patients as well as prestress abnormalities that may allow the formation of a stone within the urinary tract; and 5) to study in a systematic way the epidemiology and genetics of urolithiasis in a well defined population base.

FAMILIAL AGGREGATION OF INFLAMMATORY BOWEL DISEASE

A.M. Lilienfeld, Johns Hopkins University, School of Hygiene & Public Health, Dept. of Epidemiology, *615 N. Wolfe St., Baltimore, Maryland* 21205 (R01 AM 20467-03)

This study is attempting to determine if family members (parents, siblings, offspring, and spouses) of newly hospitalized cases of ulcerative colitis and proctitis, regional enteritis, and Crohn's disease of the colon have greater prevalence of these diseases than family members of controls. Newly hospitalized cases are being ascertained through a case register in Baltimore and from local hospitals. Medical records of cases are being abstracted; and reviewed by a gastroenterologist. Cases and family members will be interviewed regarding previous illnesses; tobacco, alcohol, and dietary habits; and demographic characteristics. Information will be obtained concerning all family members, living and dead.

Hospital controls will be matched by sex, color, and age to each case. Hospital controls and their family members will be interviewed in the same manner as cases, and medical records will be obtained. Neighborhood controls will be matched to cases by sex, color, and age. These controls and their family members will be interviewed in the same manner as cases, and medical records will be obtained. Death certificates will be obtained for all cases and family members who have died.

Serum will be collected from cases, controls, and family members, and will be frozen at -70 degrees centigrade for future studies.

NATURAL HISTORY OF ARTHRITIS AND RHEUMATISM ON THE GILA RIVER INDIAN COMMUNITY

P.H. Bennett, U.S. Dept. of Health & Human Services, Public Health Service, National Inst. of Health, National Inst. of Arthritis Metabolism & Digestive Diseases, Southwestern Field Studies Branch, *Phoenix, Arizona* 85016 (Z01 AM 69009-15 EFS)

The development and progression of various forms of arthritis is being investigated in an American Indian population. The patterns of joint disease will be examined to determine if distinctive patterns of degenerative joint disease can be recognized, and if so, their evolution and outcome will be followed. In addition, the prognostic significance of various factors related to rheumatoid arthritis and ankylosing spondylitis will be examined.

The study which includes clinical radiographic and serologic studies of joint disease is a part of a prospective study of the Gila River Indian Community in which studies of diabetes mellitus and other diseases are being undertaken.
